: The Portfolio was obviously an advertisement, but are all the rest mentioned
: (8bits in movies) ads as well, or did they just get sneaked in for free?

Low budget movies used the Atari because it is so cheap obviously, not
for product placement. These movies with 800s in them probably came out
far after the 800 was discontinued.

As for the Portfolio, this too I think was NOT a product placement. The
portfolio was really a pretty dead issue by 1991. What the Portfolio was
was one of the few palmtop computers at the time which made it 'look the
part'.

The only product placement happened during the Warner era when Atari was
still a player. Atari really ceased being a player after 1984.

Some Corvus systems only use 2 joystick ports.

However, the Corvus system uses a custom OS board so using it on an XL/XE
would be problematic anyway.

: up/download, capture buffer, etc..?

: How about creating a BTM file for VT100 emulation for Bobterm?

I think it is pretty much a pipedream to get VT100 into Bobterm. Clay establishes his own custom screen routines and stuff to allow high speed, the PMG underlays for bold text, and all the keymapping, and the chat buffer.

Clay still wants to cooperate with Tom Hunt to share common file transfer protocols which Tom is writing. Tom is working on his own term, an outgrowth of CGSTERM. I don't know how far he is on that one. I think Tom realized that Bobterm was NOT going to get a revision and there were things he wanted to have in a term like better scripting ala Backtalk and a more progressive and expandable file transfer system.

Clay says he wants to put in a capture/scrollback buffer and stuff but who knows when he will attempt it. The last few revisions have been 'the kitchen sink' additions to the VT100 emulation and options. Items which are welcome, but by no means do or die.

Message-ID: <9411010007591.DLITE.bjcorr@delphi.com>
Source record: 97605

I am running a corvus HD on an 800 and an Integrater Board. Under Smart Dos all is wounderful, but when I try to boot up Mydos it locks up halfway into the load. If I unplug the corvus, Mydos happily loads. I have tried Mydos 4.5 and 4.53, same result. I want to use Mydos so I can get 8 corvus volumns up at once, Smart Dos only allows 4. (Actually I would prefer a CLI, but Sparta definitly won't work with the Integrater board, it doesn't use SIO.)

HELP!!!!

I have heard of others using Mydos with my hardware setup, so I am baffeled!

6035. New standard

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-01 05:24:30 UTC
From: DJCHENG@frost.oit.umass.edu
Message-ID: <394jee$rtq@nic.umass.edu>
Source record: 97616

Just by way of introduction, I was introduced to the Atari 8-bit
by my cousin, who had an Atari 800. I went out and bought an 800XL, used
it for many years, and then put it in the closet after going the ST and
PC route. Once in a while it comes out when I feel nostalgic.
Anyway, I've just discovered the internet, and I'll throw a
couple of ideas out:

Now that Atari no longer officially supports the 8 bit line,
should not some consortium of developers meeet and determine a "new"
standard? From reading this newsgroup, a lot of 8bit users now have
upgraded systems that are no longer limited to 16K/64K/128K.
I've also seen talk where a developer is making such and such
a board, but its for hobbyists and programmers only, because there will
not be software for USERS to utilize the new [insert hardware development
here]. In some ways, this problem could be eliminated with the hardware
developer contacting several software developers and entering into a dialog,
in other words, creating a developer's list just like Atari would have
done.

I just think that with Atari no longer supporting the 8 bits, some
people need to continue the grass-roots effort at supporting the people
who still use the 8bit. Some people need to get together and create a
"new standard"

Just for example, how about a new standard for 8bits, at least
256K or 1 meg memory and a hard drive. All new software should be developed
to run off a HD, with ability to run off floppies a secondary concern.

Etc, Etc. I know there are some diehards out there ("real
programmers do it in 8k" and all that), but I see that many people already
have some sort of upgrade in their machine, and in many cases some have
computers that just barely resemble their original 16K purchase...

Now, if this has already been done, sorry, I'm just rediscovering
my interest in my 800XL after discovering this newsgroup....

Not true. The Corvus drives;
1) Operate via joystick ports 3 & 4, and therefore will not work with an 800XL.
2) Do Not have a custom os board, their software modifies 2.0 to operate via the joystick ports and then functions just fine on a stock 800. You can however install a custom board, the Integator, that makes using a Corvus much more bearable, but will not work with some DOS's (that do not use SIO like Sparta.)

Current Notes has been running a "series" of Diamond GOS articles by Kevin Packard that show one how to do various things with that product. I have Diamond myself. I liked the paint program myself. The word processor (Write) pretty much sucks IMHO. I don't think it was ever really finished. The basic desktop is functional, but an occasional weirdness does pop up. I used the product with SDX and it hangs occasionally or the configuration file gets corrupted. The mouse interface is pretty clean.

Whats the point? If you want lots of memory and a hard drive
then go for any modern PC/Mac/Amiga. If you really want to have
modern facilities then the old 8 bits aren't the right machines.

Of course theres nothing wrong with pumping up your 8 bit, just
that it would be silly to try and make a standard on the premise
that you need 'modern' features.

I dont know. I think the remaining 8bitters out there already have
advanced machines. Most folks I know, anyway - have a good sized
ramdisk, hard drive and at least 2400-14.4k modems. I suppose a defacto
standard already exists - as I've noticed that more and more software
apps are tending toward hard drive/ramdisk users.

6045. COMPLETE 6502 tech reference available?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-01 17:40:50 UTC
From: boutell@netcom.com
Message-ID: <boutellCyLns2.DM4@netcom.com>
Source record: 97620
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2.programmer

Hi there. I need complete 6502 machine/assembly language
specs. I'm perfectly willing to buy a book, but can't find
anything on the shelves anymore, except for a couple of
less-than-thorough books in libraries.

(6507, actually, but it's the same chip minus a
few features.)

I know my bit-twiddlin' and I don't need a tutorial.
I just need the complete specs, particularly on things
like the "V" flag (which instructions set it and when?)
and the BIT instruction ("it tests bits" is not a
complete description of behavior...). I've already
got most of the instructions covered, but I'm
going nuts trying to reverse-engineer some
of them from a beginner-level book and a
list of opcodes.

Obviously, I'd prefer an online reference if such
a thing exists, but I would be perfectly happy to
get ordering information for a book.

Please email, and thanks. I will make any useful
information I receive available to others. Note the crosspost
(I included both common classic systems I'm aware of that
use the chip, although my project involves neither system
directly).

Oh yes, one other thing. I understand there are a few
"illegal" 6502 instructions that are commonly used.
Can anyone give me opcodes and descriptions for
these? Thanks!

From: tdrake1@umbc.edu
Message-ID: <3962ai$qvu@news.umbc.edu>
Source record: 97621

Has anybody tried hooking up a Canon BJ-200e inkjet printer to the Atari 8-bit? If so were you successful?? Any significant limitations or compatibility problems?

I know that some people have hooked up their 8-bit up to an Epson Stylus 800 and even the older model HP 500s.

As I understand it, the Canon BJ-200e will emulate an Epson LQ-510 and the IBM Proprinter 24.

I have been looking at upgrading my old Epson RX-80 to something with a bit better output. The price is down in the $225 range now for the Canon-BJ200e.

GA> 300bps. Can I emulate VT-100 without additional hardware
GA> (e.g. 850 interface or Hayes comp. modem)?
GA> I would really appreciate any assistance.

No problem. Step One: You need to get ahold of the XM301 RS232
device driver. Step Two: You need to get the --FULL-- distribution of a
program, such as KERMIT-65. Many bulletin boards just include one
executible that has already had an ATARI 850 device loader appended to it.
You need to get a hold of programs that contain --NO R: DEVICE HANDLER--.
The --FULL-- distribution of KERMIT-65 for the ATARI comes with an
executible called K65NR.COM, which stands for KERMIT 6502 with no R: device
handler appended. Keep a copy of this file and create another copy of it
to which you then append your XM301 R: handler. For programs which "chain
load" the device handler, you would rename any file called "RS232.COM" to
-- for example -- "OLDNR.COM" and name your XM301 R: device handler as the
new "RS232.COM" to take the place of the previous handler. Most terminal
programs work with multiple R: device handlers. Find the --FULL--
distribution of programs such as KERMIT-65 and BOBTERM that supply versions
with and without R-Handlers. I believe that the distribution of ANSITERM
also supplies an executible with no built-in R: device handler, as well.
You do not --NEED-- an ATARI 850 to do VT100 emulation, that is just the
default set up. You only need to do a little extra work to change the
default settings (i.e. find R: device driverless executibles, an XM301
handler, full documentation about how handlers are loaded, etc.)

P.S. I am not an XM301 owner, so I can't help you on the specifics of your
particular device.

P.P.S. If you are still stuck, give another shout on the net (although I
don't know how you'll be able to download anything sent point-to-point?).

Good Luck!

ben corr (bjcorr@delphi.com) wrote:

: Not true. The Corvus drives;
: 1) Operate via joystick ports 3 & 4, and therefore will not work with an
: 800XL.
: 2) Do Not have a custom os board, their software modifies 2.0 to operate via
: the joystick ports and then functions just fine on a stock 800. You can
: however install a custom board, the Integator, that makes using a Corvus
: much more bearable, but will not work with some DOS's (that do not use SIO
: like Sparta.)

Well, using it without the Integrator is probably a bitch since the hard drive becomes nothing but a TON of 720 sector pseudofloppies and being able to swap on the fly (like a BB/MIO/MUX swapper) is a must.

Remember, this was from the days before subdirectories and >720 sector support in Atari DOSs.

I don't know if there are any hacked formatters that would allow, let's say, MYDOS to see a Corvus drive as one large partition. Obviously that would be more useful.

6054. Atari books wanted

James King (jeking@xmission.com) wrote:
: attributes. No offense to Clay, as Flicker is nice - but I just cant
: stand the compressed and flickering text. I've tried to use my Unix
: shell account using Bobterm, but both versions of VT52 (E/O) simply do
: not like to work with programs like IRC, TIN and ELM.

Unfortunately only things lice VT100 and VT220 and such are compatible
with IRC, TIN, and the like. VT52 COULD support those programs but even
if you change your TERM type, it won't support it. I've tried too.

Well, the XEP-80 has a firmware ATASCII font. Therefore there is NO
tilde or backquote characters (tilde is important in Unix for referring
to home directories, etc.). You will also be locked into the stoneage
with no greater than 4800 baud throughput. Choose your poison, dude.

Of course, VT850, the only XEP-80 compatible vt100 terminal, maxes out at
1200 baud (YIPEE!).

If you want nice text, wait and see what FTE comes up with for the MIO 80
collumn board. Or pursue the ISA slot > cart thing which already works
with a Hercules graphics card. Of course both things are going to
require SOFTWARE to drive them.

: and 4.53, same result. I want to use Mydos so I can get 8 corvus volumns up
: at once, Smart Dos only allows 4. (Actually I would prefer a CLI, but Sparta
: definitly won't work with the Integrater board, it doesn't use SIO.)

SpartaDOS patch Z uses SIO. That's why it works with the MUX which
rerouts SIO through the cart ports. 3.2z disables US+ sector skewing.

>

Generally, whenever the studio prop department needs something
"futuristic" or "techie", they try to find the lowest cost items
available. For example, it is a well known fact that Star Trek's Dr.
McCoy's medical apparatus were anything from salt/pepper shakers to camera
lens holders.

6058. Re: New standard

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-02 00:44:04 UTC
From: krishna@max.tiac.net
Message-ID: <396nck$rp2@sundog.tiac.net>
Source record: 97630

Hardware is not the problem. Software is. We could easily establish a new standard up to and including a 65816 system (like what FTE is exploring) as long as the users see advantages to the upgrade.

At this point, there is really just a small list of programs that will use BANKED ram, and these are crippled by:

A) not being hard-drive friendly
B) not being open-ended to support anything over 256K at the most.

So it is a double whammy because the banked ram standard should have been established a good 5 years ago and software should have been expanded to support hard drives and upgrades up to 1 megabyte when the slow DRAM chips the 8-bits use became SOOOO dirt cheap.

So it is a curse because even if we DID have applications which maxed out 4 megabyte banked-ram machines, it would STILL be technically backwards compared to viable 65816 systems which CAN be produced at just about an equally economical level for the same userbase.

So the 8-bit is really hardware-rich at this point, and software poor. Sure, it is starting to HURT us that we are locked at 1.79mhz with no 24-bit address bus, but it's hard to mourn over that when the software still isn't catching up with the amazing hardware we already have.

Just a humorous anecdote.
At work today, a coworker showed me Simple Text, the replacement basic text editor for Macs (to replace TeachText).
He also had a MacTalk (or something like that) extension installed on his machine.
There was pull-down menu for various "reading" options to have the computer "speak" the document to the user.

Funny thing is, it didn't sound a damn bit better than SAM that I got for my 800 around 10 years ago...

Source record: 97644

If the only limitation to using a Corvus on an xl/xe is the lack of ports 3 and 4, why not just do a search and replace with a decent disk editor, changing all the PORTBs to PORTAs? That, and checking for any TRIGs, should be sufficient.

The XEP80 actually has 3 fonts in its ROM; ATASCII, European (like the alternate xe/xl charset) plus an ASCII font which has the tildes etc. It isn't shown in any of the demos (because it's a real pain to use) but it is in there, ready to be used. If you look through the tech docs for the XEP on the handler disk it describes how to access it; I believe if you look at one of the demos, you can alter it to display the ASCII set rather than the european; I think all it takes is to add one to the control value.

Even with the Integrator it is a brain damaged way to implement a hard
drive. The best you can do is format all the Corvus Drives as DD and get a
DOS that supports 8 drives at a time, still very limiting.

>Remember, this was from the days before subdirectories and >720 sector

Yes, nothing as useless as subdirs on a 720 sector Corvus Volumn.

My friend and I were cleaning out one of his storage sheds this weekend. Amid the piles of Model Cars, Trains, and RC stuff, we found a Box O' Atari off in one corner. Upon opening the box we found an Atari 1200XL, 800XL, two cassette drives, a printer, and miscellanious cabling, etc.

Now, we both realize this stuff is OLD, but rather than leaving it in the shed to rediscover in a few years ("I claim this for Spain!" - Magellan), he would like to dispose of these items with someone who would be interested in them and who would give him a few bucks for the lot.

The plastic cases have the usual amount of fading one would expect on these old machines, but otherwise seem to be in good\reasonably decent shape. If anyone is seriously interested, please e-mail an offer and we'll pack these up nice and tight and COD it out to you. He may consider some trades as well (I noticed someone offering a two-line Cordless phone - who knows?).

Obviously he would like to dispose of the lot rather than piece it out, so please keep this in mind. If you are interested, I will get these this weekend and see if I can power them up and make sure they run.

Oh, and he also has a HUGE Apple Daisy Wheel printer (Centronics Interface) that, minus the dust and dirt on the outer case, is in great shape and runs fine, slow, and loud. Anyone interested? Ah, come one, don't you need a good printer\door stop\car lift? :-]

'Preciate it.

Daniel J Cheng (DJCHENG@frost.oit.umass.edu) wrote:

[Various Sections cut- see original article]

: Now that Atari no longer officially supports the 8 bit line,
: should not some consortium of developers meeet and determine a "new"
: standard? From reading this newsgroup, a lot of 8bit users now have
: upgraded systems that are no longer limited to 16K/64K/128K.
:
: Just for example, how about a new standard for 8bits, at least
: 256K or 1 meg memory and a hard drive. All new software should be developed
: to run off a HD, with ability to run off floppies a secondary concern.

: Etc, Etc. I know there are some diehards out there ("real
: programmers do it in 8k" and all that), but I see that many people already
: have some sort of upgrade in their machine, and in many cases some have
: computers that just barely resemble their original 16K purchase...

: Now, if this has already been done, sorry, I'm just rediscovering
: my interest in my 800XL after discovering this newsgroup....

At the risk of sounding rude, that's one of the worst ******* ideas I've seen
for some time. Sorry, but it *really* sucks.
Having programs which support 128K or more is a great idea, granted, but
making this the "standard" is just plain stupid. I own 2 8 bit Ataris, one
is a 64K 800XL, and the other is a 128K XE. What you propose throws anyone
who doesn't have a massively expanded system out in the cold. Like
someone else said, if you want huge hard drives and megabytes of memory,
you buy a bigger computer. Part of the reason I like my 8 bits is their elegant
design (no, I don't mean the cases!), but partly because you don't *need*
tons of memory. Of course, developing programs for, say, 64K means you can
do it much more comfortably in say, 128K because you have some leeway, but
to make 256K for example, the standard risks alienating everyone who doesn't
have that. If you're happy with a 1 meg 800XL fine, but don't force
everyone else to follow suit. Personally, I'll use my Amiga for that sort of
stuff, because it's a machine which can make the most of the memory
without being wasteful (a la certain PC programs), and it has the speed which
makes developing, say, graphics better than an 800XL. Problem is transferring
them without an 850 module, but I don't see that this is an insurmountable
problem.

I won't complain if you develop a 1 meg XL application, but don't
expect it to be that popular either. What's the point of programs that big
when you're still limited by the 800XL hardware? I like my XL, but I'm
not going to claim it's at the cutting edge of technology any more...

Graeme Fenwick gfenwick@mcs.dundee.ac.uk

6071. New Standard

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-02 12:36:34 UTC
From: mbitdc9306@titan.newi.ac.uk
Message-ID: <94110212175214@titan.newi.ac.uk>
Source record: 97646

Actually, this idea about setting up some kind of standard would not be a bad idea, but I'm not really sure how it can be implemented. There are several problems to overcome:

1. Programming lazyness. Programmers are a notoriously lazy bunch (myself included) and we'll always try and find the easiest route to writing a piece of software - a bit like lightning finding the easiest route to earthing itself! For example, my current project (out in two weeks, folks) uses almost the entire memory in a 64K Atari but if I was so inclined, I could have saved up to 5K on the biggest program in the package by writing better routines, compressing the text output a bit (there's a lot of blank spaces in there) and countless sundry other things. Give the programmer 1Mb to work with and he may produce something amazing but it'll only be half as good as it might have been because 1Mb is a lot of RAM to fill and it'll only make him more wasteful in his programming practices.

2. International Differences. Basically what this means is that something that may be commonly used in one country may be extremely rare in another. For example, hard disk users may be plentiful in the States but they're pretty thin on the ground in the UK. I know a few people with Black Boxes over here but they're the exception since the Black Box is expensive to import (that damned Government slaps VAT on anything expensive that's imported into the country). I've just ordered an MIO II and that's a bit closer to many people's price ranges so I'm hopeful that we'll find UK users taking hard drives to heart.

3. The PC Conundrum. Right, what this means is - look at the PC! It's supposed to be pretty standard throughout, isn't it? What about soundcards, though? You have the soundblaster standard, the Roland standard, the Gravis Ultrasound, the .... Even if a standard is specified, chances are that someone will produce a piece of kit that will not work correctly under the guidelines and so it may be ignored by programmers, or they may add that piece of kit to their list of 'things to do' for a particular piece of software.

I'm sure that something can be done, but it is going to take quite a bit of the old will power all-round - particularly from us programming types.

Hallo folks !!!

Some weeks ago I started my question on Atari power-supplies, but I got no message about it!

Here`s the question once again:

I got two original Atari power-supplies with the size of the 1050-ones.

The input is 240V/50HZ/38VA/AC
The two (!) outputs are 8.6 V/1 A/AC
29 V/600 mA/AC

If you have any information, where they could be from or which units need these kind of power, please send a mail to:
belitz@genesis.informatik.rwth-aachen.de

I agree that Action! is the language of choice for the Atari 8-bit.
It was designed with the 8-bit in mind. While it isn't as advanced as other
languages like C, it does a reasonable job at exploiting the 8-bit's
capabilities.

>Action! does support records & the manual lists an example of
>a company employee list for reference. The only downsides I've heard
>about Action! is lack of direct floating point access & built in
>banking access to 130xe memory.

Though I don't know of any readily available routines to use 130XE extended
memory, I do know of routines to support floating point numbers. They are
included on the Action utilities disk (sold separately from the Action!
cartridge). There are lots of goodies on this disk, including player/missle
routines.

>It's not really a problem for me

: So the 8-bit is really hardware-rich at this point, and software poor.
: Sure, it is starting to HURT us that we are locked at 1.79mhz with no
: 24-bit address bus, but it's hard to mourn over that when the software
: still isn't catching up with the amazing hardware we already have.

That is why I would like to see software developers contracted
to develop some software for the new tech, but that cannot be done unless
there is some hardware standard for the programmers to refer to.
I forgot to address one issue: that of people believing that
the original machines will be left in the cold. 1) many people have
already upgraded 2) how many 600XL users complained when many programs
came out for 48K or 64K?
Many people would like to push the limits of their 8bit and see
no reason to get another computer.
Maybe a new standard might be out of the question FOR NOW (but
its been so many years, WHEN?), but is there a regular developer's conference?
I don't know if there are still enough to warrant a conference, but its
just an idea.

I've read that the Corvus drive uses joystick ports 3 and 4. Could it be that your copy of Mydos is set up for an XL/XE ramdisk? If your 800 has a ramdisk, Mydos should be configured to use the correct port address (probably C000).

Marco Schumann (maschuma@news.cs.TU-Magdeburg.DE) wrote:
: I am looking for a documentation about the ATR-Disk-Format. Can somebody
: give me info?

From the SIO2PC readme file:

STRUCTURE OF AN SIO2PC ATARI DISK IMAGE:

It's extremely simple. There is first a 16 byte header with the following
information:

WORD = special code* indicating this is an Atari disk file
WORD = size of this disk image, in paragraphs (size/16)
WORD = sector size. (128 or 256) bytes/sector
WORD = high part of size, in paragraphs (added by REV 3.00)
SPARES 8 (ten) unused (spare) header bytes (contain zeroes)

After the header comes the disk image. This is just a continuous string of
bytes, with the first 128 bytes being the contents of disk sector 1, the
second being sector 2, etc.

* The "code" is the 16 bit sum of the individual ASCII values of the string
of bytes: "NICKATARI". If you try to load a file without this first
WORD, you get a "THIS FILE IS NOT AN ATARI DISK FILE" error
message. Try it.

A note from me:

On double-density images, the first 3 sectors take 256 bytes, but
only the first 128 of each are used. This is incompatible with the
current release of PC-Xformer. The author is aware of it.

greetinatari junkies,

I am presently useing an atari game system..the one with detachable
keyboard and what not. Just a while ago i was at a thiftshop near my house and
saw they had a 65XE there for 10 bucks or so. My question is, are these two
computers basically the same thing? is the 65 nothing more than a bit smaller
and in a nicer case?

few more questions while im here. :) i have heard somewhat about 80
col support for the 80..is the ONLY way to get 80 col is by that adapter that is external?
was any of the xe line made
with built in 80 col support? the main reason i want 80 cols is for
tetecommunications, wich brings me to another question..

I am at the moment useing BOBTERM..pretty nice term program.. i recent
got a copy of ANSIter, from nic.funet.fi, however i cant get it to work with
my sx212..i load up the handler and then the main program, however when i go
to terminal mode all i get is a bunch of blue lines drawing themselves over
and over again. has anyone got this program to work?

Also, has there been any term progs with color in them? i dont mean
just ANSI, but how about at least CBM color? anyhting out there?

One last thing..are there any PD bbs programs for the atari? i havent
seen them on any of the FTP sites, so i was wondering if they were any out
there..

ah well, if ya know the answeres either reply here or mail

Well, you could sell your 800+Corvus to a collector and pick up an 800XL and an MIOII and be able to run IDE drives. It's not like you are locked under the thumb of the Corvus. The Corvus was a real amazing feat for 1980, a $5000 piece of hardware for the Atari. But by 1985 when the MIO came out it was rendered obsolete. The ATR hard drive interface wasn't that great but that sounded better too. Actual drive throughput through the SIO (ATR) can't be that fast, and I shudder to think what the throughput must be with the limited bandwidth of 2 joystick ports. It is not the ideal way to have an Atari 8-bit hard drive. It is mainly a really great COLLECTOR's item and I'm sure in time it will appreciate in value as such.

I've also heard of CART-based hard drive interfaces from Europe. Some hacker was working on it I think. The cart port is just as good as the PBI for simple data I/O and in hindsight the Corvus system probably should have hacked the cart port.

Supporting big upgrades is different from REQUIRING big upgrades. I don't think he meant that everyone should write programs which should ONLY run on upgraded machines.

However, the only way the 8-bit will be able to interface with the rest of the computer world is to take advantage of banked ram for larger programs just like what Puff himself did with SuperArc to uncompress Squashed(?) files.

Things like DTP/FAX, LHA and ZIP compression utilities, these things will probably require banked ram just for the program itself.

The biggest problem with a 64K limit (in my opinion) is with APPLICATION programs. You have to share main memory between the actual program, and data/buffer space. What usually happens is that you are left with an insanely small buffer to work in, which is the case with several word processors and spreadsheets for the Atari. Once they started making 16-bit machines, they went from 10K text buffers for word processors, and megabytes of room (depending on how much you have) in even an ancient 68000 machine commonly sold for little more than Atari 8-bits are. If that doesn't display the limitation of a 16-bit address buffer I don't know what does.

So theoretically you can use about 32K or so for the main program and only reserve the bank window and you can cram the program full of features and use the banks for buffer space and write a program progressive enough to work with large upgrades.

And again, even if we are stuck with a slow processor, the benefits of a 24-bit address bus can not be overstated.

: There was pull-down menu for various "reading" options to have the computer
: "speak" the document to the user.

: Funny thing is, it didn't sound a damn bit better than SAM that I got for
: my 800 around 10 years ago...

To be fair though, it doesn't tie up the CPU 100% like SAM does, does it?

That's the difference between something that is useful only as a demo,
and something that can be used in programs.

I've got the speech for the Amiga and it is better than SAM, but not
PERFECT. It was written with the 7.56mhz Amigas in mind so it doesn't
really push the sound chips to the limit. But it's good and it leaves
tons of CPU time left for multitasking.

SAM seems to have better control via knobs than the Amiga speech does.
The Amiga can shift between male and female vocal structures and can
adjust pitch but can't seem to adjust nasality or open-throatedness. So
SAM does have a few advantages on that level.

But I think the Amiga one can be coaxed to SING.

The best speech for the Atari was probably the Alien Voice Box which CAN
sing, steals next to no CPU time, but it is a pretty rare item and I heard
it is flaky on XL/XEs.

>routines.

I think there is a WAY to program in Action! and use up separate banks for code. But it is very messy. I tried playing with it for a while and gave up because it was so much effort. It is a lot easier to write in assembly when planning on using the other banks for program space. Action's compiling process is the culprit here because you have to compile each bank separately so each bank with have its own island of variable names in the bank window and stuff, when what you REALLY want is to have a globally shared symbol/variable table. Jumping in and out of the banks becomes a real bitch because none of the procedure/function names will be recognized unless declared manually and pointed to the right address. This can be done by using a scanning utility Tom Hunt wrote. Essentially you compile each program, then scan it and find out where each routine is in memory, then when the bank is called up, have it run a routine at a fixed address which tells Action! where all the routines lie. Then you can jump back and forth between the bank and the main memory areas freely. Jumping from bank directly to another bank is even more of a bitch. Then you have to worry about passing parameters. AAAA!!!

It is NOt just a matter of twiddling portB.

If ACTION! were updated, I'm sure it could work out a kluge to be able to write banked programs. But right now it isn't really set up to be able to do this.

Well, I remember the early Alan Alda ads when the XL line first came out. It's kinda funny since it's probably one of the few times Atari advertised their products (especially computers) like this. I have heard of the elusive ads for the Lynx on MTV, but I can't say I've ever seen one. I *HAVE* seen a slew of advertising for the Jaguar (sometimes the same commercial TWICE a commercial break). Every time I see these commercials, I think how lamentable that Atari didn't have as aggresive a marketing campaign for their computer line...

Motorola Inside!!! <hmmm...>

I've wondered how much different RAM Upgrades already exist,
which use different Bits of the PIA Port B Adress for access.

I think this is because there are many Bits already used at this
particular Adress, like for switching OS ROM, BASIC ROM, SELFTEST ROM,
XE BANKS 1-4, ENABLE BANK FOR CPU, ENABLE BANK FOR ANTIC.

I own a recently upgraded 800 XL (Claus Buchholz Upgrade) and making
a defacto Standard for upgraded XL/XE's is really necessary.

I also agree that new Software shouldn't rely on upgraded XL/XE's but
Support of the additional RAM would be great.

Just my opinions

>apps are tending toward hard drive/ramdisk users.

I don't buy that! I know a lot of people that have just standard machines.
Maybe most people here on the net have upgraded machines, but there are plenty
of others who don't. All I've got is a ramdisk for example - no modem no HD.
Others don't even have that. Maybe some upgrades are more common in certain
parts of the world than others. Modems and HD's don't tend to be all that
common on 8-bits here (Britain) - probably because we don't get free local
calls like our friends over the water, and there has been no easy, relatively
cheap and available way of adding a HD. The now defunct Gralin used to sell
a HD interface..but even their description of it made it sound complicated!

I'd be interested to hear what the situation is in other parts of the world.
How many people do have ramdisks, modems, hardrive and other such add ons?

6101. Standard Graphics Formats

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-03 10:30:39 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1994Nov3.103039.1691@cs.nott.ac.uk>
Source record: 97546

Ok all... I'd like a little bit of help from all you lovely people in net land.
What I'd like to know is which are the most common formats for saving pictures
in on the 8-bit. I've already got the standard 62 sector format (used by
micropainter and others (?)) which is 192 lines, 40 bytes per line (Gr.15)
(7680 bytes) followed by 4 bytes of colour registers (708,709,710,712).

What other formats are out there? How are they arranged?
I'm looking for anything in any graphics mode that is reasonably wide spread.

Thanks! E-mail would be nice (if possible), otherwise posting here is fine.

I agree with Raphael on this as well- things are always cheaper in the states,
(not to mention the fact they have a relatively high income compared to other
countries too), I for example couldn't afford that sort of system. It'd be
nice to have an XL/XE hard drive, but It'd be significantly more expensive
and less useful than one for a 16/32 bit machine (ironically). Who's going
to define the standard? You can only have a standard when the manufacturer
(the *sole* manufacturer) says so, otherwise there will always be
non-standard developments. Support extra memory, don't rely on it though.

: thought...

This is happening frequently for other classic systems.

Wayne Westmoreland and Terry Gilman, who wrote some very popular games for the old TRS-80s, just released a bunch of their old games (Eliminator, Armor Patrol, etc) to the public domain, along with a lot of alternate versions and unreleased stuff (including a Donky Kong for the TRS-80!). Most of these games were released by Adventure International (whatever happened to Scott Addams?). They included a text file with some notes, and the games are even available in virtual disk format for Jeff Vavasour's excellent Model I/III emulators for the PC.

The Commodore 64 community has an FTP site setup with tons of games for the C64 emulator....

The 65XE is basically the same as the game system except that it does not have Missile Command built in, and it has a monitor output with separate chroma and luma (gives a clearer image on a monitor that has chroma/luma inputs, like the Commodore monitors). Another difference is that the 65XE uses eight 64Kx1 ram chips, while the game system has two 64Kx4 chips. Both models have the ram chips soldered in, making it difficult to add more memory.

Raphael; I probably count as a near harware junkey vs a true one since I don't have a hard drive, but... I've got some stuff like an ATR8000 with two 720k drives so I don't really feel the need for one. I used to have PR:Connection/850/ATR serial ports, but my PR went south due entirely to my negligence. I had to be one of the first people to buy a rambo, it didn't even come with a ramdisk handler at the time that would use the full 192k so I ended up phoning 1/2 across the U.S. to download one from the ICD bbs. I also added a 256k Newell upgrade to another xl & have recently aquired an 800 with the 128k axalon board. I was at 2400 baud as soon as Supra's were available via mailorder for $118. I even had a EPROM burner until I loaned it out & it came back busted. I've also got a couple of hacks that used to get plugged into my xl that no one else has, but nothing that would be significant to your average user. I don't know what it's like in the U.K., but ram here is dirt cheap. I've found clone AT motherboards with 1 meg of ram selling for $10. $10/36 drams=> you can upgrade an xl for less then $2.25 in dram. The prices for things like rambo boards is still way to high, $28 to $40 depending on where you shop, but everything else including the computer is cheap. I guess there are some people who don't have hacked Ataris, but I'd guess around 25% of the computers that are still in use in the US have been upgraded.

: Ummm...what's the point in using a 14.4 modem on the 8-bit when all the
: 8-bit terminal programs skip that baud rate for some odd reason? I think
Actually, on my MIO, if I set the baud rate at 19.2k, I can always get
maximum throughput - irregardless of what type BBS/service I call. I've
gotten CPS values in excess of 4000 before on my little 8bit - of course,
that depends on the xfer prot. and the type file xferred.

: funny characters kept popping up on the screen and the modem wouldn't
: respond to anything I did.

I also have a PR: and it's no good after 4800.. Of course, I had an older
PR:C that would do 9600 and somtimes 19.2k without noise.

Ok folks, just to throw my 2c in, I develop software (sorta.. hehe).

When I am in the process of designing something (ie, "Hmm.. what should I support?") I usually think to myself "If they had a RAMdisk like I do, or a hard drive, I could add in cool graphics or better sound when I get around to making the thing".

I'm not gonna babble on forever, but just name two pretty good examples:
1) TextPro .. works fine on 48/64k, supports any-drive (RAM/Hard/Floppy), also supports more RAM
2) MegaBlast .. works fine on 48/64k, but you have a slight advantage if you have 128k.

Think of Alternate Reality. Some people bitch that it doesn't support RAM-disk or hard drive... oh well... if/when I make a multi-DISK game, I'll be sure to support it.. ANY configuration I can think of. From one 88k floppy to a huge 16mb hard disk partition or 1mb of RAMdisk space...

THe Koala format (old, sure, but it was quite popular) is another one.

BTW The GRx (I call it that) format is usually 40 x height bytes (ie,
80 x 192, 160 x 192, 160 x 96, 320 x 192) with 712, 708, 709, 710, 711...
at least that's what most programs seem to support (viewers, GIFNCode, etc.)

Forget the name of it.. either MicroPainter or MicroIllustrator or something..

I hope someone else can answer this, because I can't. However, if all else
fails, I can mail you the diskette (sure, it is low tech, but what the hell!!)
and it should reach you in a week or so.

Regards,

Vince

: funny characters kept popping up on the screen and the modem wouldn't
: respond to anything I did.

Don't ask me how it works. You just set the PORT speed to 19.2k and it works. You just need an MIO (with revised R: handler) or a BB or a future R:P: to make sure hardware flow control negotiates things. Throughput between the modem and the computer will never go above 19.2K and will probably vary depending on how much compression it can do. The modem to modem speed will be fixed at 14.4.

Even with a 2400 baud modem, if it has data compression you could do the same thing and get faster performance than just straight 2400 baud. In fact, I've heard that 9600 baud performance on the 8-bit very close to 14.4 performance since the compression ratio of 14.4 is at least 4:1 and usually today's computers use a port speed of 57K baud with them, not 19.2K.

I know from my Amiga that with file transfers the CPS can be from 1500-over 5000 CPS depending on whether the file is already compressed (like .gifs). With the Atari, file transfers can go up to around 1200 CPS maximum on 19.2k connections.

Going to high speed is MOOT unless you have the right interface, though. But the reward is less waiting. You'll get more done in the same amount of time because you won't be waiting for screen refreshes and the like. Vt100 has a shitload of overhead in the escape codes. I don't think 4800 baud is fast enough for me. It's a personal choice I guess.

Today, the best way to support banked ram is to configure it manually with a text file or something so it KNOWS which bits to twiddle.

Not by using a menu with an incomplete list of upgrades, NOT by trying to figure it out on its own, and NOT by just assuming RAMBO compatibility.

As long as its banking scheme (capacity, bank address, and byte stuffing values) is configurable the program will be instantly compatible with everything. The reason I include BANK ADDRESS here is in case you had a successful PIA2 upgrade and had 8 free bits in PORTA of PIA2 to twiddle plus I still have no idea what MARS8 does. Axlon upgrades would probably be problematic because their bank window is in a different spot I believe.

The problem with application programs is that they are totally fixed by the time they were made and do not have provisions for any future contingency.

> If you know the speed, number of pins, fonts supported, whether
>it handles graphics, etc. for this printer, please post them here or
>e-Mail
>me with them, if you prefer.

Ummm...scary question. Considering I used to own 2. I now own one with a
broken manual-feed knob.

Ok...on to the specs...

2 I/O ports
9 pin
Fonts: Ascii, ATascii, foreign character set.
Epson compatible, but you would be better off finding a copy of the
XMM801 -> Epson printer driver that was put out by the now,
unfortunately, defunct BellComm.
It barely handles graphics and uses a carbon ribbon instead of ink.

That's my $0.02!

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

Source record: 97468

I've had a good deal of experience with Corvus drives on Atari 8-bits so I think I'll jump in to this discussion.

The Corvus to Atari 8-bit interface uses exactly two joystick ports -- ports 3 & 4. It was designed for use on an Atari 8oo, but could conceivably run on an 800XL or 130XE. The main modification required would consist of changing all references to PORTB to PORTA, and all references to PBCTL to PACTL. Since the standard Atari OS doesn't recognize a Corvus, it cannot boot from one. Thus you must either boot from 1) a floppy which then boots DOS.SYS from the Corvus [this was supplied with the Corvus drive] 2) a cartridge which fits in the right hand slot (I've never seen one, but they exist) or 3) [best option] acquire a replacement personality board (Integrator) which allows you to boot from any Corvus volume, any floppy drive, or your Axlon/Axlon compatible RAMdisk. or 4) a cassette containing the code to boot DOS.SYS from the Corvus [a program to write such a boot cassette was provided with Corvus's Atari
8-bit software package that came with the drive].

To run a Corvus on an XL/XE, with an Integrator personality board or the cartridge boot system, you would have to burn custom EPROMS of the modified software, since both the software to be modified is on ROM chips.

The Corvus does not *have* to use a custom OS board. The Integrator board is an option. I highly recommend it, though, since it adds direct operating system support of Axlon RAMDISKS, allows you to swap any physical drive with any device number (D1: through D8:), allows quick changes to the Corvus mount table, and allows you run MyDos and full disk programs on your hard drive, as opposed to the modified DOS 2.0D which you are forced to use if you don't have the Integrator. What Mr. Corr said of SIO is true; the Integrator only works with DOS's that use legal SIO calls to access the drive, hence SpartaDOS X and SpartaDOS will not support the Corvus. The Integrator, regrettably, does not overcome the problem of partition size; it is still only possible to have 180K partitions on a Corvus using the integrator. A patch for MyDos could be written to overcome this. This would be a very short patch, since the Integrator would do almost all the work of swapping partitions (see below). The SIO calls in MyDos would be patched (namely, the read and write sector vectors). This would be the extent of the patch. Prior to calling the built-in ROM SIO routines, the patch would:

1. Divide the sector number by 720 and store the remainder of the division.
2. The whole number result of the division in step [1] would be the Corvus volume number that the sector resides on. The volume number would be incremented by one, since the Corvus volume numbers begin at one instead of zero. The remainder of the division would correspond to the sector

number on that volume. The one-byte volume number would be stored in RAM as the 'current volume' following step [3].
3. The patch would check to see if the drive number (eg D1:) in question is presently set to the 'current volume' calculated in step [1].
4. If the drive were not presently on that volume a JSR would be made to $C000 in the Integrator ROMS. This configuration routine is built into the integrator and fully documented within the integrator manual. This would reconfigure that drive number (eg D1:) to the volume number calculated in step [1].
5. The sector number would be changed to the remainder of the division from the calculation in step [1]. Thus, sector 725 would correspond to sector 5 (remainder of 725 divided by 720). Similarly, the volume number would be the integral part of the division plus one -- thus sector 725 would be on volume 2)
6. The patch would proceed to call the built-in ROM SIO routine, which would then get or put the appropriate sector number on the appropriate volume.
Note that this patch would work for everything -- even directory reads -- since MyDos would be seeing the Corvus as one large drive. Also, delays due to volume changes would not be excessive, since the configuration command would only be issued at 720-sector intervals.

I do not believe any such patches were ever written but I think I've demonstrated the necessary logic to do the deed. MyDos doesn't pay much attention to checking if a configuration is legitimate, so you would just specify the number of sectors and tracks corresponding to six megs, ten megs, or twenty megs, and use the [I] command from the DOS menu to write out a legitimate directory structure. Once the patch is installed with the modified directory structure, it would work like a charm. Whenever a sector above 720 is accessed, the patch would catch it. The format XIO call would not need to be altered; the integrator ignores this anyway. Incidentally, David & Sandy Small were geniuses; they might have already implemented the patch into the OS; what happens when you try to access above sector 720? Does it lock up, or does it automatically change volumes, or give an error?

Finally, regarding speed: I once did a comparison of the speed of the Corvus vs the Blackbox hooked to an SCSI drive. I don't recall the exact results, but the data rate was comparable. The joyports are plenty fast; the problem is the software. One advantage of the joyports is that (had the software supported it) the drives would work with every single 8-bit computer ever made, without any adapters. The cartridge port would have the same advantage as an interface. Not supporting all platforms is one of the disadvantages of all existing HD interfaces, except for the ATR8000, which is slow and doesn't support SCSI.

Hey, even the PC terminal programs skip 14.4k. You're getting the
modem to modem speed confused with the modem to computer speed.
Standard speeds being 2400, 4800, 9600, 19200, 38400 and 57600.
(there are lower and higher rates, but it seems nothing between.)

For example, I have a v.32bis modem on my 486. The port speed
is 38400 (highest the modem supports). On compressed binary data
I get about 1600cps; text at around 3000cps... having a high
modem to computer speed is a good thing, if your interface can
handle it.

FOR SALE CHEAP--800XL (64K), 400 (16K), 850 Interface

All of the above have been taking up space for the last 10 years.
I have decided to get rid of the lot (including all old
Atari magazines--years worth of Analog and Antic) to anybody
who will take the pile and pay for shipping and handling.
I figure that about $50 will cover the expense of boxing
it up and shipping it out.

The 400 has the coveted B-Key keyboard, and all machines have
powersupplies that work. I'll even throw in an original Atari
joystick if I'm feeling generous. No floppy drives, tho--sold
them ten years ago.

Please mail your eager responses to the above address--I obviously
am not a regular reader of this newsgroup.

Yes. Today's modems constantly compress data at both ends, but not from
modem to modem or at least not as MUCH. They do this because the physical
limit of the phone lines has pretty much been reached.

So graphically it would look like this on an Atari 8-bit:

```
Atari dialup
19.2K port 19.2K port
connection connection
\ /
\ /
\ /
\ 14.4 signal /
\_____________________________________________/
MODEM = - -= -=-= -=phone line =- = -= MODEM
v.32 comp. _____________________________________________ v.32bis
/ \ compression
/ \
/ \
/ \
/ \
/ \
/ \
```

I think that if the dialup is set to 57K or more it will still work. As
long as the Atari has hardware flow control negotiating things. This
setting on modems is pretty fixed so although it works, it leaves the
higher setting on (in this case 57K) just sitting there with extra
bandwidth wasted. It only takes one end to impose a limit on both ends.

On most modems slower than 9600 the diagram would be like this:

```
300/1200/2400 baud 300/1200/2400 300/1200/2400
-------------------------------------------------------------------------
MODEM -- - - - - - phone line -- - -- -- MODEM
-------------------------------------------------------------------------
```

No compression, one fixed setting. Port and actual line speed are identical.

>

It's actually fast? Will wonders never cease... I guess we are thinking about how slow SINGLE joystick things are, like those 300 baud modems and digitizers. Once you move to 2 joystick ports I guess it does more than even double the speed capability. The only other interface that uses both joystick ports I know of is the ComputerEyes one. I know this has been hacked to stream hard drive backup data to VCRs before, so this may be another indication of double joystick speed. Hard to tell.

I just assumed that 2 joysticks would be slower than SIO. But essentially 2 joysticks is parallel, not serial, so I guess it could be a lot faster.

These days the cartridge board is the best place to hack for universal HD interfaces. The MUX shows how well this can work. It leaves the joysticks free for games, etc... With the 800 it didn't matter because 99% of the games didn't support 4 joysticks.

>Rick
I think the problem here is not so much price, but of people willing to
hack up their machines. Especialy when replacements aren't too easy
to find anymore. Recently Richard Gore brought back the Yorky board
which is just plugs into the PBI, but even then people didn't jump at the
chance of buying one. Maybe us brits are just too consevartive. I used to
be like that.. didn't see the need for extra bits and pieces. Now that I've
got my ramdisk I can't live without it ;)
I couldn't get much use out of a modem personaly (no telephone line ;))
and a HD is out of my price league... Now a 3.5 drive is something I would
REALLY LIKE....

You want something like MyDOS's RAMdisk setup? No way! I never did
get that thing working right, and my 256k RAMBO is one of the most
common upgrades around.

The ideal thing is to give a list of common choices, but also allow
customization beyond (or instead of) that. That way you take care of
people who have no clue about how their RAM works ("Um, I know it's
256k, and I'm pretty sure it's a RAMBO thing", and the people who
custom-designed their own 4-Meg RAM upgrade.

Heck, if you get really ambitious, have the program attempt to
(non-destructively!) figure out what sort of RAM setup you have --
always allowing for user customization, of course.

As annoying as those posts are (I'm sure glad my newsreader doesn't
force me to read them), I'm glad there are no set, enforced
restrictions on that sort of thing. We must rely on courtesy, gentle
reminders, and occasionally a message to the poster's admin (which is
likely to be ignored, but may result in that person losing access).

I suggest that everbody who finds those posts annoying send the poster
a message saying so. Maybe if he gets more complaints than bids,
he'll stop.

: GA> 300bps. Can I emulate VT-100 without additional hardware
: GA> (e.g. 850 interface or Hayes comp. modem)?

: No problem. Step One: You need to get ahold of the XM301 RS232
: device driver. Step Two: You need to get the --FULL-- distribution of a
: program, such as KERMIT-65. Many bulletin boards just include one
: executible that has already had an ATARI 850 device loader appended to it.

FlickerTerm and Ice-T (check em both out!) both include executables without
R: handlers, for the simple reason that every interface requires a different
handler. Ice-T includes a seperate 850 handler (for you to append to Ice-T
yourself), because it wasn't too hard for me to find (I own a 850). :)
The ARCed Flickerterm I have doesn't seem to include a handler, you just
append your own.

: is that it transfers data by track other than by sectors.

The XF551 is allegedly (I don't have one) faster and more compact
than the 1050. It's much more quiet and is designed in a cream color like
the 130XE and 65XE. Using DOS XE, it can store up to 360K per diskette
vs. 127K on the old 1050. This is a drive I'd like to learn more about,
because it's VERY hard to find. I don't know any of the pros and cons, or
how I could go about purchacing one. If anyone can help, I'd love some info!

6161. 800XL system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-06 19:11:02 UTC
From: sharakan@think.com
Message-ID: <39j9o9INN5l7@early-bird.think.com>
Source record: 97561

FOR SALE: Atari 800XL with the following features:
- ICD RAMBO XL 256K Memory upgrade
- Atari 1050 Floppy Drive with ICD US Doubler HW upgrade
- Commodore 1702 Monitor (w/separate chrom./lum. mod in 800XL)
- AID R-Verter Serial Bus MODEM/printer Adapter
- Cermetek 1200 BAUD MODEM
- Epson u82A dot matrix printer (haven't used in ages; worked last time I did)
- Several different models of joysticks (might not all work)
- Tons of software, including
- Atari DOS 2.0, 2.5, 3.0 & 4.0
- SmartDOS
- SpartaDOS 3.2
- Omnicom shareware vt100 emulator which provides readable
80x24 screen with the Commodore monitor and sufficiently
robust emulation to run things like GNU Emacs and IRC (I'm
using this combo right now to type this in)
- Turbo BASIC
- AtariWriter
- Data Perfect Database manager
- VisiCalc
- SubLogic Flight Simulator II
- Loads of other utilities & games (~50 double-sided floppies' worth)
- Lots of documentation, reference manuals, Atari-specific magazines,
articles, technical info, extra floppies, etc. etc.

Everything is in working order unless specified. $300 or B/O gets you
the whole kit and kaboodle. I will only sell this a a set. I also
don't want to deal with shipping, so you'd need to be able to pick it
up from my home in Brighton, Mass. Home phone: (617) 734-1314

Source record: 97482

For some of my goofy hacks, I've had no trouble simulating a 19,200
serial port with a joystick, so I'd imagine using all 8 bits would be
about 8x as fast as a standard serial device. I've been delving into
different serial data formats lately & learned a bit of info that
was interesting to me. Apparently a lot of older keyboard/terminal
interfaces just used a serial to parallel converter circuit with the
start bit triggering a latch or interupt to indicate EOC. I don't know
of a 9 bit serial to parallel converter so I guess it explains why there's
a lot of old stuff that only understands 7 bit stuff. Makes me wonder
just exactly how they did the handshaking on a Corvus?
BTW: I was dating a woman years ago who was best friends with the wife
of one of the Corvus founders. We were over there one night & she said
"Let me show you <forgot his name! ARRGHH!> new car." We went out to the
garage full of Teutonic nuts & bolts. A 635 BMW, Porshe 911<?>, and a
brand new Porsche Cabriolet. The rest of my story is not fit for telling.

the xf551 is double sided and double density, while the 1050 is single
sided and only "enhanced" density. The 1050 can be upgraded to double
density and high speed, but not double-sided.

> Also what is a happy drive? My understanding
>is that it transfers data by track other than by sectors.

I think every Happy upgrade (for both 810 and 1050) increases the data
transfer rate, and the Happy 1050 upgrade also gives the 1050 double
density.

I think the Happy upgrade also involved some other enhancements, but I
never had a happy so I'm not sure what they are.

That's weird. I ran it with my Corvus and Happy Warpspeed Dos on an 810, no problemn (never did get Sparta X to go. They gave me a patch for it and no lue as to how to use it.) It was just severley buggy upon exiting any program to DOS, and cursor movement with the trackball was NOT proportional which was silly, took forever to move the cursor around.
Diamond Write and Diamond Paint were %$#@*&!!!

I have owned a Happy enhanced 810 for many years and it had 2 claims to fame;
1) If used with the Happy Warpspeed Dos (modified 2.0) it had VERY fast
I/O as in US Doubler modified 1050's. Unfortunately the Happy 810 never got
the support that the Happy 1050 or US Doubler did (does not do Warp speed
with Sparta or anything other than Warpspeed Dos)
2) It's main claim to fame - Since it allowed complete control over the
drive it was capable of copying protected software via the Happy Backup
Program. It could analyze several protection methods and defeat them or use
PDB files (pre-defined backup files, config files to program the drive for
certain programs that had new schemes.) The software could also compact
protected disks into files and load them, with a menu, on "compacted" disks
with other compacted programs to save disks. It had several rather cute
features, like the tracker program which would, once enabled, let you load a
piece of software, run it as normal, and upon exit would save a map of all
disk sectors accessed, so you could copy just those sectors to make a broken
copy of the program. It even had the ability to be "unhappy" and behave as a
normal 810, to fool programs that looked for a Happy enhanced drive so they
could shut down before being run. The drive had a 4k buffer (never saw any
articles on how to get in and program the drive myself, but it has been
done,) and even available was a Happy Customizer program to let you make
custom disk formats! The folks at Happy computing were very knowledgable
about the drives and the manual (which I have) is full of info. They even
included a mod to let the drive slow itself down to write more than
19sectors/trak, a common protection technique.

Oh well, history now. If anyone has need of the manuals for Happy 810 or the customizer, drop me a line. OOPS! wait...
Does anyone know if the Happy 810 software, customizer software or manuals were released to the PD? Any idea on how to make the Happy 810 work at high speed with Sparta X?

Hey, I've got one of them V.32bis modems your company sells.

And YES I'd like that 40MHz 6502 in my 130XE and 800XE.

6174. CardStax, MODs etc.

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-07 02:09:24 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199411070209.AA164194157@relay2.geis.com>
Source record: 97489

Actually, CardStax doesn't play MOD files. (I should know,; I wrote the thing!) It plays Pokey Player files. It's a limited hypertext system for the 8-bit.

It's designed around cards (screen displays) which branch out to other cards (and so on). A collection of cards is called a stack.

I haven't even looked at it for a while now, but it does support mixing text, graphics (micropainter, 62 sector, print shop icons) and sound (pokey player files) on screen; graphics modes 8,9,10,11 and 15; mouse, joystick or touch tablet control; screen dumps to Epson/compatible printers (SIO only, no joystick interfaces); up to six branches off each card; user-designed assembly routines can be called on loading a card or on selection of a branch. There's even a reserved block of memory for user routines (one of those bugs that became a program feature). The program itself is written in standard BASIC; most routines are assembly to speed it up.

Unfortunately, I never wrote any really good utilities to create cards and stacks with. The current ones are limited at best. As well, the current version works under MyDos; I haven't tried it under Sparta, though I'd imagine it would only need a few minor changes in a few XIO calls.

I wrote a quick review and description in Current Notes about a year ago.

If anyone is interested, I'll DCM it again and FTP it to the Umich archive.

If you've got any other questions, feel free to ask away.

Dave Paterson

6175. Atari Printers

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-07 02:37:01 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199411070236.AA196895811@relay2.geis.com>
Source record: 97490

The XMM801 was a decent printer by Atari, though a few years late. I believe that the Daisy Dot printer programs support the XMM801.

The Atari printer that was a repackage microline was the nefarious 1025 combination printer / doorstop. I've still got one gathering dust on a shelf; completely indestructable by anything less than a nuclear strike. It was a slow a 7-pin printer with NO graphics and no descenders. Its only redeeming feature was that is hooked up via SIO; it was Atari's first direct-connect 80 column printer (the 825 printer required the 850 interface).

Ben Poehland wrote about his 1025 in one AC issue - it was his labelling workhorse for the magazine.

6176. Serial to parallel

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-07 02:37:26 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199411070236.AA196805803@relay2.geis.com>
Source record: 97491

One way to go serial to parallel on a 6502:

This assumes that the byte in INPUT_PORT is valid serial data, all 0 except bit 0 which is the data bit (binary %0000000d). It also assumes a high start bit. DATA_VALUE is the value read so far.

```
CHECK_DATA
; routine to see if there is a bit waiting.

GET_BIT
CLC
LDA DATA_VALUE
ASL
AND INPUT_PORT
STA DATA_VALUE
BCC CHECK_DATA

; here we store the data in the buffer, and reset DATA_VALUE to 0
```

I had originally planned this for a joystick port interface, with 3 bi-directional data lines and two handshaking lines (one in, one out to each machine). Data coming in in sets of 3 = 3 sets per byte. My intent was to use bits 0,1 and 2 for data, Bit 3 for handshaking out, and the trigger for handshaking in. Never did get around to it, though.

Dave Paterson

GS> with IRC, TIN, and the like. VT52 --COULD-- support those programs but
GS> even if you change your TERM type, it won't support it.
GS> I've tried too.

That's only because some programs explicitly look for particular TERM types as part of their startup routine. Micro-EMACS, for example, is intelligent enough to handle forty column BOBTERM, except that the EMACS prompts are eighty columns long. If you have access to the source code, you can cut the prompt lengths, force the screen size to forty columns, and perform other custom modifications. (If I remember, VT52 lacks a Line Delete / Close Over Line capability, and VT52 also lacks scrolling regions, but BOBTERM does support a Line Delete function.) If you take out the code block that demands a VT100 class terminal, EMACS will run, but you have to hardcode the source to make it fit the BOBTERM parameters (i.e. it is no longer general as the GNU project didn't code for forty column terminals). EMACS isn't terribly useful in forty columns, practically worthless. Fullscreen forty columns with wordwrap would only be useful if you were typing a newspaper column, since the world uses eighty column screens for the most part. Other than that, formatting for forty columns isn't useful, and you wouldn't see enough of your text. There wouldn't be a significant difference over using ED. VI would be pretty nice in forty columns, though.

GS> Well, the XEP-80 has a firmware ATASCII font. Therefore there is NO
GS> tilde or backquote characters (tilde is important in Unix for
GS> referring to home directories, etc.). You will also be locked into
GS> the stoneage with no greater than 4800 baud throughput. Choose your
GS> poison, dude.

Using a Tilde is not a --REQUIREMENT-- of UNIX, only a --DEFAULT--. UNIX is --CUSTOMIZABLE--, not "brain dead" ! You can just as easily use $HOME for your home directory. If you lack a tilde on your IBM EBCDIC terminal you can go into your ".mailrc" file and tell UNIX to use a Cent Sign or a Supernaught/Degree, or Underscore, for example. We are talking UNIX, here... --EVERYTHING-- is customizable! (Well, I don't know how inflexible ELM is, but the original UNIX software tools are amazingly flexible.) EMACS does fullscreen amazingly intelligently. TIN is a bit

stupid when it comes to updating the screen, using more of a brute force approach as if every terminal were a fullscreen system console, whereas genuine UNIX expected anything from a clanking TeleType 33 to a plasma display to be connected to it. (You can use STTY "keymap", TR, PERL, or other UNIX lexical programs as an input filter to assign another key as a functional "backquote" evaluator if it is absolutely necessary. You are never "stuck" in UNIX. There is always a work-around.)

Do these TRS-80 games that are resurfacing appear in the form of BASIC
source code (in which case they are convertible to the ATARI 8-bit), or are
they executible binary machine code? (I'm curious.)

6181. [--- Infocom Interpreters ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-07 07:30:13 UTC
From: winston@merk.com
Message-ID: <CyvzIF.7ws@merk.com>
Source record: 97499

I have been following the discussion about the public domain Infocom interpreters -- ZIP and ITF -- (available from "ftp.gmd.de" in their "if-archive/infocom") with interest. I was successfully able to build the ITF interpreter. I also downloaded the C program to convert the ATARI format database. The program says that it can convert the ATARI format of the Infocom files. It was at this point that a funny thought occurred to me. As the Infocom databases are entire sides of disks that use a custom loader and have no standard DOS to speak of, how was I to upload the raw sectors of the Infocom database so that the parser would be able to parse them? There is no directory to find a file in, and there is no DOS to execute a copy command with! I assume that BOBTERM expects a filename and an accessible directory. Is there an easy method to solving this problem? Would the D.E.C.U.S. format of the MIT MDL DUNGEON (in FORTRAN) be compatible with the Infocom interpreters or does the database need to be in Z-Machine database format? How does one upload "raw bits" that have no filename associated with them to a non-ATARI computer? I've done all of my ATARI bit twiddling on the actual ATARI, so this is a first for me.

--Thank you.

I personally know that nobody needs to worry about PC XFormer 3.0.
The docs have just (nearly) been completed. I just printed them out last night and proofread them, finding some indenting/spacing problems and a few other things which could be cleaned up a little more. (I want as little nit-picking about it as possible! :)) And Darek has informed me that the software is pretty much done as well and he's going to ship VERY soon (within the month or sooner!?). The software ALSO sounds a lot better than I imagined! (I never really trusted his claims before 3.0 started work, but I guess I was just pessimisting. It sounds VERY fast and like it's compatible with at least the more useful 8bit software).

BraSoft (Darek) can be contacted at darekm@microsoft.com if you wanna talk to him directly.

The 801 is only partially Epson compatable. The two I owned are now gone along with there manuals, but as I recall, they would only accept graphic dumps in Epson single density mode. They will do higher density graphics, but they use a different command character then Epsons.

Are you sure a HD is out of your price league? A MIO II from FTe is $99, and IDE drives are about $.50 a meg. The MIO II has everything needed for powering of the HD. I exhort you to look in to a HD setup. They are even better for breathing new life into Ataris than a ram upgrades!! Also, many IBMers out there are upgrading their HDs, leaving many 220 meg and under HDs without homes. Leave a message somewhere asking for IDE drives. I am positive you can get then inexpensively.

: format database. The program says that it can convert the ATARI format of
: the Infocom files. It was at this point that a funny thought occurred
: to me. As the Infocom databases are entire sides of disks that use a
: custom loader and have no standard DOS to speak of, how was I to upload the
: raw sectors of the Infocom database so that the parser would be able to
: parse them? There is no directory to find a file in, and there is no DOS to
: execute a copy command with! I assume that BOBTERM expects a filename and
: an accessible directory. Is there an easy method to solving this problem?

Easy, hmmmm. I had the Lost Treasures collection on order but got impatient.
I had an Atari format "Planetfall" disk to work with. To get the disk
to my PC, I made an image with SIO2PC and removed the header. Then
I ran the Atari->Z-machine converter on it. Worked. Others didn't,
but the disks were ancient, bad sectors probably.

But how to do it with what you have? You'll have to make an image
file on the Atari side. Do you have a >90K drive? Put the image
file there and Bobterm will have something to work with.

There may be utility to do this. Diskcomm will compress or leave
out empty sectors, so that won't do it. A BASIC program could
handle it. Read sector 0, copy to file. Read sector 1, append to
file. All the way to 720. Bypass DOS, or it might look for link-bytes.

Good luck. Are you going to port the interpreter to the Atari?
Can it be done?

6196. 1050 Drive Belts

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 02:41:01 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411080240.AA025152451@relay2.geis.com>
Source record: 97569

This is for Jason Bardis who inquired a few weeks ago about the crumbling belt in his 1050 (hey, I'm only 3 weeks behind reading my mail, this is PROGRESS!):

If the belt fell off by itself, that's a bad sign. It means the drive belt has become stretched (a sign of age). Contrary to their appearance, the drive belts are not made of rubber but are actually a rubber-coated fabric. The rubber coating gives them the friction grip required to stick to the drive wheels. Eventuallt the longitudinal stress forces exerted on the belt cause them to become longitudinally distorted; i.e. the belt has become permanently stretched & can no longer maintain the correct amount of tension required for it to maintain contact with the drive wheels.

Belts this old almost always exhibit some degree of dry rot in the rubber coating. Check the belt under a strong magnifier, you'll see the rubber coating is cracked & flaking off. Bad news.

I've had some success with worn belts by cleaning them thoroughly in alcohol & re-installing them INSIDE-OUT. Distorted belts always assume a circular shape, & by installing them inside-out you once again create tension in the belt. ALWAYS WASH YOUR HANDS BEFORE HANDLING BELTS! However, this little trick is only a stop-gap measure.

The only permanent fix is to replace the belt. The best source for these belts is Best Electronics (see the FAQ list). Belts usually cost $6-$12 depending on type & source. When you order a new belt, you MUST state which type of mechanisim your 1050 contains (Tandon or World Storage). The belts for those two mechanisms are of different sizes.

A rubber band will NOT make a suitable replacement for the original belt. Rubber bands will undergo excessive elastic deformation during a rotational cycle, causing unstable operation of the disk hub with respect to constant RPMs. I would expect quite a few disk R/W errors using a rubber band. Cleaning the belt & installing it inside-out is preferable to a rubber band.

Another possibility is to apply "Belt-Dressing". Stuff in a spray can from Pep Boys, used on belts in car engines. Yukky stuff, really messy. But it does seem to tone up old belts & DEFINITELY makes them much tackier. Never tried it in a disk drive, tho. I prefer to solve problems at the source & keep a supply of spare belts on hand.

6197. Percom Drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 03:41:23 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411080341.AA109956070@relay2.geis.com>
Source record: 97570

Continuing my vain effort to catch up my email, I've followed with interest the thread on Percom drives.

I just completed rebuilding 6 of them & am in the process of preparing a manuscript on the subject for AC (yes, The Alchemist is yet alive!).

The controller on the RFD40-S1 does support 80 tracks but does NOT support double-sided disks. I've not had a double-sided model in my hands but an ad from the place in Chantilly Virginia that used to service Percoms indicates the double-sided/double-density model was designated RFD44-S1.

What I discovered about the RFD40 (using SpartaDOS 3.2d) was that it WILL lay down a true 720K format on a 3.5" drive. However, the controller will only access the first 360K of it. So, in effect, the 3.5" drive becomes a 360K drive with a single-sided controller. The RFD series drivs can also be programmed using the switches to properly recognize a double-density slave drive upon bootup.

The same cannot be said of the AT88-S1PD drives. With a double-density mech installed, the AT88-S1PD WILL format single-sided/double -density on either a 5.25" mech or a 3.5" mech. However, a double-density mech slaved to an AT88 will onlt be recognized as a single density mech upon bootup. But-- if you format a double-density disk on the slave, it will thereafter recognize the slave as double-density (until, of course, you turn it off). Sheesh!

Percom could never make up its mind which type of connector to use for the slaves. Some models used 34-pin mass termination pins, others used card-edge connectors. And just to complete the confusion, the AT88-SPD used BOTH. On those models, the mass termination pin connector is for the parallel printer port. The printer port on these models works fine when directly connected to an Epson printer, but when you place a print buffer in series with the printer there is weirdness. (The print buffer problem will be the subject of a whole nuther article).

I've seen many horrors involving the power supplies in Percom drives. From the very beginning to the very end, NO ONE at Percom EVER understood how to properly mount voltage regulators. I've replaced about a million failed regulators in Percoms, all because of the way Percom mounted them. The power supply failures gave the Percom drives a bad reputation which I feel they did not deserve. The sad part of it is, the fix is ridiculously simple.

Percom tech people also didn't know how to diagnose hardware problems over the phone. When my friend's At88 died & he called Percom, they

charged him $25 to replace the SMC-made 1795 FDC chip on the controller card (they mailed him the chip). He plugged it in, the drive was still dead. (It was a failed regulator- as usual- that was the culprit!) Percom claimed the SMC-made chips tended to overheat. Baloney! Several of my Percoms contain SMC chips & run just fine.

I disagree with recently proposed nomenclature I saw posted here on RFD-series drives. It read: RFDxx-Sy where is number of tracks on the wups....
where xx is the number of tracks on the originally installed mech & y is the number of sides on the mech. I don't think so. Such literature as I've seen indicates the model nomenclature should be as follows:

RFD4x-Sy
x=0 --> a single-sided drive
x=4 --> a double-sided drive
y=1 --> a single-mech drive unit
y=2 --> a double-mech drive unit

So, is everbody suitably confused now? :)

6198. CSS XF Dual Upgrade Problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 04:15:18 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411080414.AA161098083@relay2.geis.com>
Source record: 97571

I noticed the post a few weeks ago from someone experiencing a problem with a 3.5" mech slaved to the xf551 using the CSS Dual Upgrade.

My gut feeling is that the problem lies with the mechanism you are using Two important details were not given: a.) the brand of drive mech; b.) whether the disk inserted in the drive was a QD (720K) disk or a HD (1.44M) disk. The density of the mech being used was given as 1.44M.

I have 3 CSS Dual-upgrade modified XF551's in service now for several years & find no problems with them. HOWEVER, when I was first setting them up I ran into difficulties that lead me to feel this upgrade is rather "touchy", in that if you stray from the instructions given by CSS you are asking for trouble. CSS SPECIFICALLY states you should not use 1.4M mechs with the Dual Upgrade. (Of course, 720K mechs are almost impossible to find these days!). I tried a variety of 1.4M mechs & found that some worked & some didn't. It has something to do with slight differences in head timing, it's far more critical in the HD mechs & may not be compatible with the Dual firmware. This problem even occurred with some QD mechs & CSS was obliged to revise the ROMs several times to accomodate differences in various brands of QD mechs.

I recollect I was successful in formatting a QD disk in a 1.4M Teac 3.5" drive using a late version Dual ROM. However, that doesn't mean the Teac 1.4M drives being sold today will work! Dadburnit, Teac has changed their hardware several times in the past 3 years, it has driven me crazy. Each revision results in a physically flimsier drive. One thing they did that bummed me out was reduce the drive select positions from 4 to 2 (God bless IBM, where, as everyone knows, you NEVER have more than 2 drives, right?).

I also tried a an Epson QD mech that didn't work, I gave it away.

Bottom line: if you buy the Dual upgrade from CSS, you are well advised to buy your 3.5" mech from them also. If you stray beyond their recom-mendations, you're on your own.

And if you are unwary, the Murphy Demons will get you.

6200. Just can't get along

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 05:36:24 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411080536.AA276672982@relay2.geis.com>
Source record: 97572

<A problem with the ICD P:R:C was desribed...>
I see at least possiblities that should be checked into here.
First, open the case of the P:R:C & look at the circuit board. If the board says REV 3, the problem is likely in the P:R:C. There were nasty bugs in this version. ICD quietly upgraded it without ever admitting the problems. One nasty bug in particular was a tendency for the REV 3 P:R:C to drop your connection when you went local.

If the P:R:C is REV 4, I would say the problem lies somewhere outside the the P:R:C. I no longer actively use my P:R:C, but I did experience difficulties with a REV 4 unit when I first configured my main system with lots of junk stuck on the SIO. The P:R:C was unreliable. I did al all kinds of stuff to fix it, including the addition of bypass caps to the +5 line, nothing worked. The flaky behavior continued whether the P:R:C was at the beginning, middle, or end of the serial chain.

The cure was the Amplified SIO Cable from CSS. This cable contains a chip that beefs up the signals on the SIO & gives you a strong signal regardless of how many feet of SIO line you have on there. I've not attempted to reverse-engineer this thing, nor was I ever to get a straight answer from bob Puff on exactly how it works. MY gut feeling is that the P:R:C may be sensitive to the capacitive effects on signal waveforms due to added cable length. I did notice a number of odd effects as I added more or less SIO cable. All this vanished when I added the SIO Amp Cable from CSS.

One other <dumb> thing I tried was replacing the custom SMT chip in my P:R:C (an ICD rep told me I had a bad chip & would have to send the unit in for repair). Instead, I bought the chip from Best for $16 & replaced it myself. It took me 2 hours, it was my first experience with surface-mount technology. (I have a vague recollection of the effort being accompanied by quite a few colorful expletives.) The repaired unit functioned exactly like the original one-- I accoplished nothing at all except a waste of time & money.

The CSS Amp cable *might* also cure problems on a P:R:C with a REV 3 board. However, since there's no way to determine which problems are caused by a buggy P:R:C & which are caused by external factors, putting the amp cable on a REV 3 P:R:C is a shot in the dark.

The 8-Bit Alchemist

6201. 1.44M 3.5" Drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 06:17:54 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411080617.AA035415452@relay2.geis.com>
Source record: 97573

Percom controllers will only read/write/format 720K if you have one of the double-sided-double-density models. I would also be VERY leery of hooking up a 1.44M drive to a Percom, even if you only put 720K disks in it. My gut feeling is that success with the Percom connection would be a hit-or-miss thing.

I agree that the Black box/Floppy board is absolutely the best way to go. the BB/FB is compatible with 99% of the 1.4M drives on the market, it works great, & it gives you total compability with MessyDOS (IBM) stuff. uh... that's "compatability", above...

The only problem with the FB just now is availability. I've received grumblings from 2 people the past month who attempted to order FB's from CSS & were put on a waiting list with possible delivery in several months (eeeek!). Not a good sign...

My guess is that with the market declining, CSS is waiting until a certain minimal number of orders have been placed before having more boards made up. It's a pretty complex product, not exactly cheap to produce.

If you're the betting type, there are 2 ways to figure it:
A.) CSS will have more FB's made up this year to fill existing orders plus satisfy any "Christmas Rush" (if there is such a phenomenon in the 8-bit market any more).
B.) CSS will wait till next year to make up some more, to avoid paying the dreaded Business Inventory Tax. This is a tax all US businesses must pay to the Feds based on the value of unsold merchandise in stock as of December 31 (or whatever their tax year basis is).

Of course, the pessimistic view is that CSS will never get enough orders, so they'll NEVER get made again. Bummer.

Anybody wanna flip a coin?

Get hold of the IBMPC or Amiga versions of the Infocom datafiles and
use them.

What would be useful is an infocom engine (like ZIP or ITF) for the
8 bit so you could run standard IBM/Amiga infocom datafiles on the 8bit.

You'd really need a DD diskdrive and lots of ram though.

Alternate Reality the Dungeon supported the 64K of extra RAM in a 130XE.
Too bad it meant that with my rambo-XL the game developed a bug that made
it unfinishable with the extra ram.

>with those kind of posts? I know some other networks like fidonet restricted
>those messages because it was on every nodes dime. Now I guess you could say
>it is on everyones dime. :)

Yes, there are restrictions on commercial usage of most Usenet newsgroups.
Commercial announcements are allowable at "reasonable" intervals, but no
business should exist solely through postings to Usenet newsgroups not
designated for commercial use. Scan the news.announce.newusers group for
the policy documents.

There are no Usenet police, so like everything else, if you don't like
someone's posting patterns, tell him _in e-mail_. Posting your complaints
only further wastes bandwidth.

A solution to using 1.44's in this case is to solder a switch to the 720/1.44
sensor. I do this all the time to 1.44's that stop reading 1.44's but still do
720k or vice versa. This would probably solve the problem, if not desolder it
and use it as an IBM drive.

Still looking for a few titles for my classic collection. I'd like to buy games that are as close to "new in the box" as possible. (ie, with all manuals and supporting pieces [for example, the 'pills' included in the Deadline package], and the box itself all present and in good shape.)

I'm willing to pay very well for items in the best possible condition.

Here's the games I'm looking for:

Witness (Infocom)
Deadline (Infocom)

Thanks for reading,

Joe

6213. XEP-80 Problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-08 18:40:50 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <he-XzTy.ransom22@delphi.com>
Source record: 97589

I recently purchased an XEP-80 from BEST Electronics. It was new in the box.

The problem is, when I hook it up to my Commodore 1802 monitor, using the Monochrome jack (or the composite jack), and switching it to that setting, I get nothing but wavy, diagonal lines, making the display totally useless.

However, hooking anything else up to that 1802 using those same jacks works just fine.

Similarly, I can run the XEP-80 through a different monitor (that isn't as good), and the output is perfect.

Oh, that other monitor is also an 1802, only it has some problems with displaying the screen too low, so it is mostly unsuitable for normal viewing.

Any idea why the XEP-80 is allergic to my "good" 1802?

Anyone else have a problem like this with thier XEP-80?

Thanks,

Joe

The XEP80 requires a standard 80 column monochrome monitor. It will only
produce a standard RCA output signal, wheras your 1802 is looking for more.

Go to any decent thrift store and pick up a Magnavox 80 computer monitor
(monochrome) and plug your XEP80 into that - you'll be impressed by the
quality..

There have been some rumors floating around about GEnie dropping support for the Atari in the near future. I went to the head of the class, so to speak, to find out what the real story was. Here is the reply I received from Darlah Potechin, Chief Sysop of the Atari RT on GEnie:

From darlah@genie.geis.com Mon Nov 7 20:21:33 1994
>
> Although it is true that there will be a GUI for the Mac and IBM,
> that will not let the Atari market out. At the worse case
> scenario, we would have text. Though, a GUI for Atari is in the
> market to happen. Rest assured, Atari support on GEnie will
> continue.
>
> Thanks!!

So with evident pressure from the likes of AOL, it looks like GEnie is going to go graphical, too. Let's hope that whatever GUI tools they cook up for the Atari will be as good as their ST Aladdin software.

-Hutch- @ Fair Dinkum Tech

P.S.: I apologize for the crossposting but I thought this was important enough to justify it.

No, I don't believe that is true. For one thing, the monitor does indeed
want standard monochrome output (it has inputs for composite, separate, AND
monochrome, source selected from the front panel). For another, it works
on the second 1802 I have, as I mentioned in the original post. But,
as I also mentioned, the second 1802 also produces a screen that is dropped
down the monitor screen about 10-15 scanlines, so is not my "monitor of
choice". :)

Thanks for the response, tho.

-Joe

They're binary files, for the most part. Almost all of the commercially
released games for the TRS-80s came as compiled (filename.CMD)
executables.

>functional "backquote" evaluator if it is absolutely necessary. You are
>never "stuck" in UNIX. There is always a work-around.)

Sure, if you are a Unix programmer.

I've done some modest customization, but nothing THAT complicated. Sounds like more work than its worth when one could just run Flick or IceT.

6228. Re: Percom Drives

: I own both but the key board on the 130XE is fried and I'm considering going
: back to the 800 cept that it's so big and only has 64K vs 128K in the XE.

No difference. I think the 6502 in the 800 is a 2mhz model slowed down
by an external crystal to sync to the custom chips, not sure. But in
practice, there is no speed difference. Both are 1.79mhz.

I have an amber mono monitor that I will sell for only $5 plus shipping. I used it with my XEP-80 at one time with Bobterm but have since switched to Flickerterm.

It also includes a switchbox on the top to share the monitor between 2 composite input signals (i.e. from the atari (40 collumn) and XEP (80)).

For the record, there is already an 8-bit Aladdin system. This was crossposted from the St group so they are obviously oblivious to this fact.

However, I do not suggest GEnie. I was there and although it does sport a couple gurus (Alfred and Jeff Potter) it is not really worth the rates they charge, even with Aladdin. The system crawls so much that Aladdin doesn't really save that much money, especially the way Alfred INSISTED on uploading text in the slowest fashion imaginable just becuase 'that's the way the real Aladdin does it'. Sheesh. I used Backtalk scripts before Djinni (the Aladdin clone) and used UPLOAD mode in the editors and it was about 10-20 times as fast as Djinni.

: Yeah, when they turned from Atari Inc. to Atari Crap.

They've got a chance now with the Jaguar. But the Tramiel mark of quality (TM) is still with them. I bought a Jaguar as an impulse-buy because I just HAD to see what Alien vs. Predator looked like. The first thing I noticed was that the dimples on one of the 3 overlays did not line up correctly. I also noticed the way the manual was only B&W (shades of latter 2600/7800 flimsy dox) to shave down production costs. The manual was okay, though. No typos that I could tell of. Next was the fact that this Jaguar console I got HISSES like it is frying eggs under the hood. One of the reasons I waited a year to get a Jag was in the hopes that after all this time that they would have sold off all the 'hissing Jaguars' and the new ones would be revised motherboards. (great American workmanship no doubt) Indeed this one says Revision B on it. So either they still haven't fixed the problem or they have sold SO few of them that I have an ancient unit despite the fact that it was bought from Toys R Us who has just picked up the Jaguar.

Suffice to say, after spending over $300 for the Jag and AvP (and Cybermorphs jerkiness and bland nontextured world was not particularly enjoyable to me) I decided I could spend my money on more productive things, and returned it. A tough thing to do since my heart is still with Atari.

So if I ever get a Jaguar again, it will be at least 6 months hence and only in the context of a larger catalogue (Star Raiders 2000 perhaps???) and I will NOT tolerate a hissing Jaguar.

So I chalk this up to a 'free rental'.

(AvP is nice by the way, not perfect by any means, but very promising).

The only Atari printer I am fond of is the 1027. In fact, if someone has one they want to sell cheap that is in GOOD condition, let me know. There are a lot of occasions where a true letter quality printer could be of use to me.

They both reflect Atari's innovation in producing very inexpensive things which could give you some quality results (albeit with some effort).

Sure, you have to put up with some BS to get the most out of them, but it's fun. The lack of a tractor feed on the 1027 is the big problem. Print a large document and you will be sitting there forever. This was before the days of sheet feeders like what today's cheap inkjets up through expensive lasers use. The sheet delivery mechanism was imprecise enough that if you weren't careful, the paper could slip in mid page and spoil the print. But the quality was excellent and the rubber stamps supported full ASCII including international characters.

My 1027 essentially broke down, or I just stopped using it. I must have thrown it out or something. I wound up getting an Epson FX-80. For the purpose of writing term papers in college, I kinda wish I had the 1027 to make a cleaner paper although it would require monitoring the printing to change sheets.

In a previous article, ransom22@delphi.com (Joe Walsh) says:

>The problem is, when I hook it up to my Commodore 1802 monitor, using the
>Monochrome jack (or the composite jack), and switching it to that setting,
>I get nothing but wavy, diagonal lines, making the display totally useless.

Have you tried fiddling with all the picture settings? I also use the
aformentioned Magnovox 80 mono monitor, but when I first attached it to the
XEP80 the display was similar to what you describe. In my case, as I
recall, it was the horizontal hold setting on the monitor that was just a
tad off, but produced a wildly useless display.

I see no reason why the XEP80 wouldn't work on the 1802. On the other
hand, trust us in that you won't be duly impressed with the XEP80 unless
you've seen it on an 80 column mono monitor.

Oh, well excuse me for livin'.

GEnie currently maintains a specific area (called a RoundTable) for Atari
support including all the machines you mentioned, to some extent. This
support includes a staff of Sysops, some salaried and some as volunteers
with limited free access.

If they dropped support, this officially maintained area would go away.
That is not going to happen in the forseeable future, according to GEnie
sources. A graphical front end for the Atari will likely come about but
not until after the PC and Mac software is finished.

Clear enuf for ya?

When I had an XEP80, it worked fine on my 1702, except that the dispay
was a little tall. I used the xep80 with a TTL monitor (the xep was
modified by the previous owner), but I could have used it wth the
1702. I think I even tried it successfully on an 1802. (The 1802 was
extremely sensitive to interference from my hacked 1200xl, though.)
The output from the xep80 SHOULD work with any of: the monochrome
(green screen) input, the luma input (with nothing on chroma, gives
b&w screen), or the composite input (again gives b&w).

Good! Thanks for clarifying! I wouldn't get so ticked off except
that Atari machines underrated because they general populous thinks that
Atari isn't even in business. When you say "The Atari", most of the
population thinks about the old 2600 game system. When you are more
specific (ie. "The Atari Portfolio Palmtop PC"), people realize that
Atari is more than games and take Atari more seriously. It benefits the
Atari community. Sorry if I seem harsh, but the only way the Atari
community can thrive is by maintaining and building upon current support.
We have to let people know that Atari has a diverse product line!

Cheers,

Probably ST and compatibles. I can't imagine them going to the
trouble of programming a graphical interface for the 8bits these days.
The Lynx and Jaguar can't even use a modem, and the portfolio is
DOS-compatible.

I've noticed a lot of software I've compiled for Unix machines saying
that it could be configured for Ataris, and I've always assumed they
meant the ST family.

You did not include any reference but I assume you were referring to my
previous post. In any event, yes, I'm aware that there is a semi-version
of Aladdin for the venerable 8-bits. My post was in response to a rumor
generated by a disgruntled ST user, hence I didn't mention the 8-bit
version. My mistake. I'm soooo sorry.

Not that it matters to anyone but me, but my very first computer was an
Atari 400, serial number xxx197, as I recall, and quickly followed by a
steady march of great 8-bit systems (all except a 1450XLD). So while I no
longer program for the 8-bit, I'm not exactly 'oblivious' to the genre.

>However, I do not suggest GEnie. [blah, blah, blah]

OK, fair enough. But since you don't recommend GEnie, what commercial
service DO you recommend for Atari users? Delphi? AOL? CIS? Bix? Prodigy???

6249. Re: Who sells PC Xformer 3.0?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-09 23:20:28 UTC
From: darekm@microsoft.com
Message-ID: <Cz0wuA.G54@microsoft.com>
Source record: 97425

PC Xformer 3.0 is now shipping! I will be posting an announcement shortly. Dealers will be receiving their orders within a few days. All major U.S. Atari dealers will be selling PC Xformer, including Toad Computers, Rising Star Computers, and B & C Computervisions. See their ads in this month's issues of Current Notes and ST Informer magazines for their addresses and numbers.

For those of you who have not used the PC Xformer 2.0 freeware version, I have also just released an updated version called PC Xformer 2.5 which fixes bugs people found in 2.0 as well as adding some new features. The major features such as 130XE emulation and true PM/G support are of course still only available in the PC Xformer 3.0 commercial version which sells for $29.95. Dealers may sell for less.

PC Xformer 3.0 also comes with over 40 pages of documentation covering Atari BASIC, DOS 2.5, MyDOS, Turbo Basic, graphics modes, sound, character sets, error messages, and more. So if you have lost all your 8-bit manuals do not worry because the PC Xformer 3.0 manual replaces them.

If you want a copy of PC Xformer 2.5 to play with right away until your PC Xformer 3.0 order arrives in the mail, reply to this email and I will email it to you. Within a few days I will have 2.5 available for download from the Internet, Compuserve, GEnie, and other online services.

- Darek, the PC Xformer guy

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94
======================================================================

NEW EXHIBITORS JUST ANNOUNCED: GRIBNIF AND ANODYNE SOFTWARE!

Toad Computers is proud to announce HOLIDAY FESTIVAL '94 which will
take place on December 3rd & 4th, 1994. Last year's event drew
500 people from all over the country and featured guests and
exhibitors such as:

- Dave Small
- Joe Waters, Ed. of Current Notes
- Charles Smeton (STraight FAX!)
- Dave Troy (CN Columnist / Toad Co-owner)
- Tim Reyes
- MajicSoft
- Carter's Creative Computer
- Greg Ondo of Steinberg Jones

We'll feature free hot apple cider, door prizes and more! We'll also
have another raffle to benefit Habitat for Humanity (which raised over
$500 last year!!)

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping
Center in Severna Park, Maryland. There's unlimited free parking and
lots to see and do nearby, as we're nestled between Washington,
Baltimore, and Annapolis.

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Bob Luneski, Oregon Research
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm
```

Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146-2925

Voice: (410) 544-6943
Orders: (800) 448-8623
FAX: (410) 544-1329
BBS: (410) 544-6999
TOADFAX: (410) 544-0098

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other
information you may need, please call us!

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

Keep an eye open for further developments on the show! We plan to have
announcements on and in:

- GEnie - CompuServe
- Internet - Delphi
- Current Notes - ST Informer

We will also be mailing postcards in support of the show
sometime in November. If you know of someone who would like
to come to the show, give us their name and address and
we'll be sure they get the information!

ADMISSION IS FREE!!!! ADMISSION IS FREE!!!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

David Troy
Jennifer Troy
Ray Mitchell

James King (jeking@xmission.com) wrote:
: I'd hav to disagree with you, Glenn. You dropped off of Delphi, THEN
: GEnie, probably because of financial reasons, rather than functional..
: I stil hve a DELPHI and GEnie account, and highly recommend both. GEnie
: will sometimes slowdown, but what systems dont? GEnie has tons of files,
: and you can almost ALWAYS get an answer _ same thing with Delphi.

To each his own. It should be stated that Delphi is currently the weakest online network, and GEnie is not far behind. And most of the files on GEnie are available here on the atari.archive. The benefit of GEnie was speaking to programmers, but we are minus one now that Clay's left too. Also, GEnie is 2400 baud and you pay a shitload more for 9600 baud. This is totally archaic in comparison to dialup shells which are all 14.4. So not only do you pay more, but you spend more time downloading files. So your free time is spent less efficiently.

As for 'answers' on Delphi, when I left you and I were probably the only big diehard 8-bitters left. There was nary an 8-bit guru to be seen.

However, Delphi's pricing was better than GEnie, but still pales in comparison to dialup shell accounts. I firmly believe that pay services like CI$, AOL, and the rest are increasingly anachronistic compared to internet accounts. The only things they have over the internet are celebrity guests and graphical interfaces.

>The output from the xep80 SHOULD work with any of: the monochrome
>(green screen) input, the luma input (with nothing on chroma, gives
>b&w screen), or the composite input (again gives b&w).

Thanks, I'll try the luma input. I'd tried the monochrome and composite.

If that doesn't work, I guess I'll have to lug the whole shebang down
to the local commie shop (yep, we still have one in town) and ask 'em
to have a look-see at the monitor to find out whether or not the monitor
is at fault.

As for the suggestion that the horizontal hold is at fault, the 1802 is
seriously deficient in monitor controls. It has horiz. position, but
no horiz. hold. It has vertical hold and size, but not vertical
position. Weird.

Thanks again to everyone for their thoughts.

-Joe

>

I've been using a Tandy VM-4 green screen mono monitor with no problems whatsoever, and our club has been using Commodore monitors as well. Try different input combinations until you find the right one. Another test is to find another monitor to see if it is the monitor, the socket connection, or the cable/adapter you are using. Do all that checking BEFORE you shell out bucks just to open the monitor casing, much less service the unit.

Edition 9 came out quite some time ago. Spoke with Brad a few days ago,
and the newest catalog is still being created.

Ummm.... the statements of the esteemed Mr. Saunders notwithstanding, I am still present and active on GEnie.

Also, regarding the Atari areas on GEnie, there are two of them-- the original, 8-bit area, and the ST/TT/Portfolio/Jaguar area.

If there's any area GEnie would consider closing (and I haven't heard anything myself), it would probably be the 8-bit one.

And further, regarding the GEnie vs. Internet debate... in my experience, the exchanges on GEnie tend to be an order of magnitude more civil than what I experience as a matter of course on the internet. 100% Moderation does have its advantages.

Due to the overwhelming response, I've decided to modify the terms of my
offer. :-) I am now willing to sell this system in pieces, and would also
be willing to ship any of this stuff, except the monitor.

So, make me an offer on any or all of this stuff! And if you're just
interested in some of the software, send me email, and I can give you a
more complete list of what I've got.

Please email me directly, as I don't read this group often.

>case w/ a BB/FB &HD.

I had the same problem with my 1802 and hacked 1200xl, and the best
solution I could come up with was to keep the 1802 with my stock 800xl
and far away from the 1200xl, while using a 1702 with the 1200xl.

You might also try adding some shielding (e.g. aluminum foil) between
the computer and the monitor. Maybe inside the computer case if you
can do it without shorting things out.

>be greatly appreciated. Thanks in advance!

I don't know of an easy way, but I bet somebody could come up with
some sort of interface, probably involving an actual atari as the main
interface box. Between the cartridge port, the PIA, and the joystick
ports, I'm sure some parallel input could be worked out, and a program
could just send that input to P:.
That's one of those projects that I'd like to do some time, but
probably never will.

6285. [Repost] XEGS for sale, $35

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-11 17:28:12 UTC
From: DBSTRUTT@CHEMICAL.watstar.uwaterloo.ca
Message-ID: <DBSTRUTT.97.000C785C@CHEMICAL.watstar.uwaterloo.ca>
Source record: 97448
Cross-posted to: comp.sys.atari.8bit,rec.games.video.marketplace

The original buyer evaporated, so here it is again.

I've got a good condition XEGS with the following:

keyboard
power supply
RF cable
lightgun + Bug Hunt cartridge
standard Atari joystick in matching grey
Missile Command (built in)

Note: this unit has a strange problem: when you have anything plugged into the SIO port on the back, the sound comes out really hushed. Remove the connection, the volume returns to normal. Doesn't affect game play in any way though, and there's no problem with cartridges.

I'd like US $35 plus shipping for this.

that level of emulation, but I guess I was wrong."

- Oscar Fowler, PC Xformer user whose life was profoundly changed

Introducing...

PC Xformer 3.0 - The Atari 130XE Emulator For MS-DOS Compatible PCs
==========

PC Xformer 2.5 - The Atari 800XL Emulator For MS-DOS Compatible PCs
==========

November 10, 1994.

For more information, a product catalog, or to place an order, contact:

Darek Mihocka, c/o
Branch Always Software
14150 N.E. 20th Street
Suite 302
Bellevue, WA 98007 U.S.A.

Phone: 206-369-5513 Fax: 206-885-5893 Compuserve: 73657,2714 GEnie: BRASOFT

PC Xformer 2.5 is a free emulator for MS-DOS users who wish to run their old
Atari 400/800 and Atari 800XL software on their PC. The file XF25.ZIP is today
being released to the online services Compuserve, Delphi, and GEnie, and the
Internet. The ZIP file contains the PC Xformer 2.5 emulator, and
various sample
Atari 800XL programs and demos.

Also being released today is PC Xformer 3.0, the world's only 130XE emulator
for MS-DOS, Windows 3.1, OS/2 Warp, Windows 95, and Windows NT.

PC Xformer 3.0 is a powerful 32-bit version of PC Xformer, which runs up to
8 times faster than a real 130XE (on a Pentium) and is the only 8-bit emulator
ever to fully support display list interrupt, player missile graphics, and
GTIA graphics. PC Xformer 3.0 is available for only $29.95 U.S.

PC Xformer 3.0 also includes over 40 pages of documentation covering the use
of the emulator as well as Atari Basic, Atari DOS 2.5, MyDOS, graphics modes,
sound, error messages, and a complete glossary of Atari 8-bit terminology.

PC Xformer 3.0 also includes over 1 megabyte of public domain and shareware
Atari 800, Atari 800XL, and Atari 130XE software ready to run on the emulator.

Both PC Xformer 2.5 and PC Xformer 3.0 run on a minimum configuration of an MS-DOS (or compatible) based PC, 640K of RAM, and a VGA card. PC Xformer 2.5
is a 16-bit program which runs on 286, 386, 486, and Pentium processors, while PC Xformer 3.0 only runs on 386, 486, and Pentium processors.

Features

Many of the limitations of our old ST Xformer emulator and other clone Atari emulators have been eliminated in PC Xformer. PC Xformer is written mostly in machine language and takes full advantage of the PC hardware.

Features common to both PC Xformer 2.5 and PC Xformer 3.0 include:

- 48K Atari 400/800 emulation

- 64K Atari 800XL emulation with "RAM under ROM" memory

- allows user installable patches to the OS and BASIC

- displays all ANTIC text and graphics modes, including GTIA modes

- 256 color GTIA color palette

- displays player missile graphics (no collision detection)

- horizontal and vertical fine scrolling

- supports display list interrupts, IRQ, and NMI interrupts

- reads and writes to ST Xformer and SIO2PC generated disk images

- reads MS-DOS files directly from within Atari DOS

- switch Atari BASIC on/off with one keystroke

- switch between Atari 400/800 and Atari 800XL emulation with one keystroke

- joystick emulation using the keyboard cursor keys

- full speed emulation on a 386/33 or faster

- slow and fast modes of emulation to take advantage of fast PCs

- compatible with all VGA cards

In addition, PC Xformer 3.0 adds features including these:

- 130XE emulation with 256K of extended XE memory

- player missile graphics with full collision detection

- on-the-fly disk image swapping

- 4 voices of sound, printer, and modem support

- real joystick support

- 386 optimized code for faster speed

- over 1 megabyte of sample Atari 8-bit programs

- over 40 pages of 8-bit Atari reference documentation

Below is a list of processors and the approximate speed of emulation relative to an Atari 800:

- 286/16 - 0.3
- 386SX/20 - 0.5
- 386DX/33 - 1.0
- 486DX/33 - 2.0
- 486DX2/66 - 4.0
- Pentium/90 - 8.0

486 and Pentium users can use the slow/fast option to slow down the emulator to normal Atari 800 speed or let it run as fast as possible.

PC Xformer 3.0 can be ordered for $29.95 U.S. directly from Branch Always Software at the address above, or from these and other fine Atari dealers:

B & C Computervisions (U.S.A.) phone: 408-986-9960 fax: 408-986-9968
Mid Cities Computers (U.S.A.) phone: 310-867-0626 fax: 310-920-8933
Rising Star Computers (U.S.A.) phone: 800-252-2787 fax: 513-254-7970
Toad Computers (U.S.A.) phone: 800-448-TOAD fax: 410-544-1329

In addition, our Gemulator 3.02 Atari ST Emulator for MS-DOS can also be purchased from the above dealers and these international dealers:

ACN (Holland and Germany) phone: +31 23351100 fax: +31 23361444
FaST Club (U.K.) phone: +44 602445250 fax: +44 602445305

How is digitized sound accomplished on the 8-bit? I've seen it many
times(ie. MegaBlast, Parrot2 Digitized Music Player, etc.) and I have no
idea how to do it...and would love to know.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

The Atari 1025 does use spool-to-spool ribbons, but it is far from letter
quality. :) I believe the print head produces a 5x7 dot matrix.

What you are experiencing is the inabitlity of the p:r:connection to keep up with modem speeds beyond 2400 baud ... tho I have not experienced it, I have read of it quite often. Whichis the reason that the mythical r:p:connection has been proposed, which will handle 14.4 K bps.

That sounds right. It was the 1027 that was the letter quality (in the
old sense-- the thing clacked away like a typewriter) printer.

Although the 1025 is far from letter quality, it is still capable of some
very nice print-outs, especially so with a new ribbon.

I'd say the 1025 was more compatible with an older non-electric type-writer.

```
Greetings A.B.B.U.C. !

UUDECODE it ? No problem... this UNIX system can do it.

DECODE with LHARC ? How ? Is there an LHARC for the 8-BIT ?
Do I track someone down who can do LHARCs ?

Move it to the XL ? Huh? But I am --ON-- the XL right now!
That is what I download to. I use KERMIT-65,
BOBTERM, ICE-T, FLICKERTERM, TERM-80, OMNITERM,
to talk to this UseNET NewsGroup.

Does LHARC assume that there is a 68000 CPU machine in the middle,
or can UNIX and the ATARI 6502 8-BIT handle it? I have never heard of
UNIX doing LHARC format before, only COMPRESS. Would Bob Puff's LH-1
beta UNLZH decoder handle it?

Thank you (Sorry to be such a bother.... I'll see if I can find
someone who can LHARC.)

Good question, especially in light of the new Atari 8-bit emulator for the PC, there's going to be demand for 8-bit software. I don't know of any sites yet, but I have a helluva lot of
Atari 8-bit stuff - hundreds of disks of the stuff. I've already converted much of it to the
Xformer format (.xfd files). If you find out a good place to post this stuff, let me know too!

Two good spots to UPLOAD files are 1) atari.archive.umich.edu
(/systems/atari/8bit/New) and 2) xmission.com (/pub/users/jeking/Atari/New)

To DOWNLOAD files, just try mirror.archive.umich.edu and you'll get
connected to one of three or four FTP sites.

From: heller@akh104.rh.psu.edu
Message-ID: <3a2qid$vhv@hearst.cac.psu.edu>
Source record: 97315

Did the 1027 printer always not print "perfect"?
The letters are never perfectly aligned straight across the page...
I was wondering if this is because its old...or because a spinning wheel
is hard to stop.

[Article crossposted from comp.sys.atari.st.tech]
[Author was Rod McCall]
[Posted on 12 Nov 1994 17:21:18 GMT]

Connect an XL to a Falcon so that you could click on an icon and
up would pop an XL window?

I know it sounds 'strange' but it would be quite good fun to be able
to open up a process running on an XL card and run it at the same
time as other progs.

Hi!

Does anybody have specific information about FTE products like MARS 8
etc.? What is MARS 8 exactly? What other hardware products have they
released yet? Are they currently working on new hardware? How much will
they cost?

Yes, I know. Too many questions! Hopefully I'm not the only one who wants
to know all that ;).

My dad is getting rid of his old Atari magazines. He says the stack is about 2 feet high, and mostly Antic's. If they are not gone soon, he will throw them away. He lives in Grass Valley, California. If someone would like to go by and pict them up, they are free. He is not interested in mailing them. My dad's phone number is 916 273-0830.

: or can UNIX and the ATARI 6502 8-BIT handle it? I have never heard of
: UNIX doing LHARC format before, only COMPRESS. Would Bob Puff's LH-1
: beta UNLZH decoder handle it?

There must be a unix lharc/unarc program someplace. I have seen files named lzh but no lha on ftp. There ARE unix zip/unzip and these are great utlities for 8-bitters to have available off their dialup shells.

The lack of lha/unlha is a big reason there aren't enough .mods around. However, I'd be glad to unlha mods for people since I now have an Amiga.

What happens I think is the stamp heads wear out. My 1027 developed
blank spots in it as the stamp wore out. But this part can be replaced
from Best electronics. You could also try lubricating around the stamp
wheels. Dust collects in there a lot so it could probably be cleaned
somehow.

I really miss my 1027 :(

Just another quick promo for the Atari Connection BBS. It's back online, and the file databases are building up quickly. Find the LATEST in 8bit Atari, ST, soon PC, AD&D gaming and .GIF images online this system.

Now, unbefore seen on ANY 8bit Atari BBS, you can read the latest USA Today paper, direct from GANNET Publishing daily. Simply access the system [L]ibrary.

Currently online from 300-2400 baud (soon back to 14.4k), with almost 800 meg of storage (with bank switching to utilizie it).

Dial 1-801-969-1468 with your Atari, PC or ST system!

While online, dont forget to enter the [G]ame room and join in the Action in Nebula E/L/I/T/E!

From: bruck@brachot.jct.ac.il
Message-ID: <9411131601.AA18267@brachot.jct.ac.il>
Source record: 97338

```
: But I think the Amiga one can be coaxed to SING.

: The best speech for the Atari was probably the Alien Voice Box which CAN
: sing, steals next to no CPU time, but it is a pretty rare item and I heard
: it is flaky on XL/XEs.

Hmmm.. I have a SAM demo that *sings* "Daisy, Daisy" with a Graphics 3 changing
(page-flipping, I think) picture on the screen.
It sounds fine, I still can't figure the lyrics out though..
(It's by Santa Cruz Educational Software, Tricky Tutorial #12, I think)

The address in the newest Current Notes magazine is given as:

Toad Computers
570 Gov. Ritchie Highway
Severna Park, MD 21146-2925

Phone 1-800-448-TOAD or 410-544-6943
FAX 410-544-1329

It is likely that either of yours would have worked too.

I uploaded version 2.5 (plus a little blurb) to the UMich archives, and I'm pretty sure it's been spread around GEnie, CompuServe, etc. I dunno if it's available for download though. (ALTHOUGH, I WAS able to get stuff OUT of the "New" directory at UMich; a bunch of GIFs which someone else uploaded.)

Samuel Lysinger <luf@tiamat.umd.umich.edu> writes:

>I was wondering about the differences between the 1050 disk drives and
>the xf551 drives. Other than one is newer and faster than the other,
>what are the differences. Also what is a happy drive? My understanding

The 1050 is a Single/Enhanced density Single Sided drive. I can be upgraded to Double Density/Single Sided with the U.S. Doubler chip set. The XF551 is a true Double Sided/Double Density drive. It also supports SS/SD and SS/ED disks in both read and wri
te modes. It has a high speed data transfer rate that can be used with Sparta X (the cart) or Sparta 3.2d & 3.2f (these require a patch) that makes a double density disk read/write with a speed like a SS/SD (on regular data transfer rates, the DD modes ar
e twice as slow per sector as is a SD mode). There is an upgrade kit available from CSS which will allow you to use a 3.5" mech instead of or in addition to the 5 1/4" mech in the unit. The biggest problems with the XF551 is the I/O ports are not very we
ll secured in the unit which can cause the traces to break if you do much removal/insertion of I/O cords and a difficulty switching from SD to DD disks with any DOS other than Sparta. The switch can be done, but it requires doing so from the DOS menu. Wi
th a Sparta format disk, just read a directory on a DD disk and the drive switches density. The density switching problem is corrected with the 3.5" drive kit from CSS or they sell a fixed drive ROM that will just take care of that problem.

I have 2 XF551 drives and LOVE 'em! I've never had trouble with the I/O ports, but then I've never unhooked the drives since I intially set them up.

: To put to mildly the 1027 is a piece of crap! I would on 100's of those
: units. The mech. is so poorly made. It never was a good printer.
: The Disk Detective

Do you have a point to make? If you are going to slag it, please try to proofread your grammar. The 1027 is fragile, like the 1020 plotter. That much is for certain. But if you are careful with it, and if you don't panic when something breaks and you just get a relatively cheap replacement, it's a fine unit for getting true letter-quality output.

The reason I forsook the 1027 and got an Epson FX-80 is that I was using it for things it was never meant for, like printing out Basic listings. I got really impatient with it since it doesn't have a tractor-feed.

You just have to know when to use it, like for writing up formal-looking documents and the like, where even a hint of dot matrixness would look unprofessional.

Yes, these days even a $200 inkjet can approximate the output of the 1027, but used 1027s are much cheaper than that.

>remember that the Scroll-Lock default is the opposite on 2.5 than it is
>on 2.0 !?
Yes, I know about that :) ! Try to run some games like MULE, PINHEAD or
INTERNATIONAL KARATE (you need to remove the copy protection of your
originals first) or even BALLDEMO. Then you'll see what I mean. Maybe it
depends on your VGA-card. I'm not sure about that.

I noticed that lots of (good) games like MULE, RAMPAGE, AR: THE DUNGEON
and many others don't run properly on Xformer 2.5. The system always
crashes at some point :(((I informed Darek about that but I haven't
received a reply yet.

BTW: I'll upload some very fine tools like TURBO BASIC :) to UMICH next
week.

6331. [--- ATARI 8-BIT BBSes ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-14 08:30:00 UTC
From: winston@merk.com
Message-ID: <Cz90y3.EvB@merk.com>
Source record: 97217

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o F.O.R.E.M. BBS -- Friends of Rick E. Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FOREM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the ATARI 8-bit
has been placed into the public domain or not. This BBS was the first to
support a RAM-disk, which Paul Swanson called a "V:" device for "virtual
disk". This BBS was written in ATARI BASIC and required a joystick
hardware "dongle" device. This was notable as being one of the first ATARI
8-BIT BBSes that could actually go for a week without having to be
rebooted. Pointers to the message base were kept in an ATARI "very long
string" (for which ATARI BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An ATARI 8-BIT version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC-XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SPARTA-DOS environment. This was a problem
until very recently, when SPARTA-DOS was released into the public domain.
This BBS program uses a "modem clock string" rather than an R-TIME-8
cartridge in order to retrieve the current time. It also comes with an
ATARI BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC-XE.
This version of FOREM BBS requires the commercial BASIC-XE cartridge in order to run. It is in the public domain and can import and export messages from the ATARI PRO! BBS EXPRESS-NET (7-BIT text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in ACTION! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE-- demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

I am the 1 of the 1 and half registered users and I am very happy indeed
with Ice-T. Definitely worth the $15 registration fee.

I just about use Ice-T exclusively for all of my VT100 netting from my
Atari 8-bit. I have used it successfully with Sparta X 4.21, Sparta 3.2d
and 3.2g, MyDos 4.5 on a plain jane 800, a stock 800XL, and on a souped up
1 meg 130XE with a Black Box, and 14.4 modem!

It is not as fast as FlickerTerm 80 but more than fast enough for normal
netting. It even has the ability to download files via straight Xmodem.
It all works for me!!

I recommend it highly. It really is a slick telecommunications package.
Yes, there are still a couple of features that would be nice like macros,
etc. but what the heck, it does work and is very functional!!
And the font looks great!

Let's support Itay and Ice-T. Maybe some of you are just not using your
8-bit for telecommunicating!!

Ice-T is much easier and more fun to use than Omnicom or Kermit.

I would certainly recommend Ice-T, if someone were asking about it.

>remember that the Scroll-Lock default is the opposite on 2.5 than it is
>on 2.0 !?

I can't get scroll-lock to do anything but lock up the computer --
certainly not speed it up.

I think Darek needs to work on the keyboard handling a bit. My Break
(shift-pause, control-3) just sends an "L" when I want EOF, so
COPY E: FILE doesn't work. The pause key required the (PC's) break key
to unpause. In the keyboard self-test I noticed a lot of things that
I thought should have been different. None of the shift-control
combinations worked, so programs like PaperClip, Action, and Bobterm
won't work completely right.
Control-Tab (clear tabs) sends a shift-backspace (delete line).
The most annoying thing was that control-F3 didn't turn off the new
keyclick like it does on the 1200xl. According to the keyboard
self-test, F1-F4 just mimic the control-arrow keys rather than the
1200xl's function keys. The code's in the OS, why not
take advantage of it? I tried disabling the click routine in the ROM
file, but when I started up again it went right into the memory test,
giving a big red bar for the first ROM block. So much for cheating.
(Is there an easy way to modify the ROM files and be able to use
them?)

But it's still a great program to have. I'll buy XF3 if some of these
problems are fixed there.

I just found the atari.archive.umich.edu Atari Archive (it was too busy, so I got
re-routed to wuarchive.wustl.edu - look under <mirrors>)

I'm still looking tho - I'll let you know when I have a definative list.

6341. Atari 1027 & 1025 Printers

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-15 06:18:33 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411150618.AA133130311@relay2.geis.com>
Source record: 97358

I was just following the recent threads on the Atari 1027 & 1025 printers.

I disagree with the negative comments on the 1027. I used 2 of them for 5 years (until I got my Epson 24-pin printers). The frustrations people have with the 1027 result from units that were defective in the box (if it printed crooked it should have been returned the day it was bought) & also to the hideously inept manual Atari supplied with the thing. I have the Atari Field Service Manual for the 1027, & even THAT is missing essential information.

All the shortcomings of the docs for the 1027 were reviwed in an Alchemist article several years ago in CURRENT NOTES (around Feb 1991????- my memory is weak here), including details on lubrication that should have been supplied by atari in the user manual as well as all the missing electronic component designations that Atari failed to provide in the Field Service Manual. The article contained a wealth of detail on the scandal involving a big batch of defective 1027 inkrollers that were sold by Atari, B&C, & Best during the period 1989-1991 (the rollers literally fell apart shortly after being placed in service & scattered ink particles all over). In the December 1992 issue of Atari Classics it was briefly mentioned that replacement rollers now being sold were not defective. After a year or 2 of hard use & several re-inkings they do eventually develop wear grooves & must be replaced. I regard inkroller replacement & proper lubrication merely as characteristics of the equipment, like periodically replacing brakes & tires on cars. The 1027 can serve very well for light printing jobs such as personal letters, memos, or short manuscripts. It will even accept continuous-feed papaer if you treat it right.

So, Glenn... you really miss your 1027? I got one as new in the box, be glad to let you have it for $35 postpaid & will throw in a whole bunch of "extras" for it including a copy of the Current Notes article. Contact me if you're interested. (I got a 2nd one to sell for $20, but it's got some "mileage" on it.)

Whoever said the output of a 1025 looks like a typewriter or approaches letter-quality or whatever (words to thst effect), has their wires crossed. I used a 1025 to print virtually all the mailing labels for Atari Classics Dec. 1992-April 1994. Literally thousands of labels! The 1025 is a text-only 7-pin dot matrix printer that doesn't print true descenders. Its output is very "dotty"-looking. The appearance of the print bears all the worst features of dot-matrix printers. But... I still use it! Not because I like the appearance of the print (I *never* use it for printing my personal correspondence), but because it's just fantastic as a mailing label printer. I did huge label runs on it, would go to bed while it

slowly spat out labels. The mechanism is extremely durable & reliable. So what if the print looks dotty? Mailing labels don't have to look beautiful! (Mailing labels get trashed after they've served their purpose anyway.) Again, the 1025 does require periodic lubrication (which Atari doesn't adequately describe in the manual, of course!), but with proper lubing & a goodly supply of new or re-inked ribbons the darn thing will last forever. I'm hanging onto mine, thank you.

The only real drawback to both printers is that they are slow. The 1025 is not logic-seeking which really clobbers its speed performance. The 1027 is logic-seeking but the complicated mechanism it uses slows it down. Both printers are about equally slow. The 1025 is really an Okidata Microline-80 in disguise, but the 1027 is an odd-fellow (I think it was made by Alps of Japan). For someone just starting out with an Atari system either of these printers are an excellent choice. They're direct-connect on the SIO (no interface required) & work fine with stuff like AtariWriter. They seem to readily available on the used market at giveaway prices & will do just fine for the average joe who just wants to bang out an occasional letter. (I wouldn't want to print an encyclopedia on one, tho!).

Just my $.02.

Phew!! What a weekend! Something like 10 hours of driving in about 3 days. I think the car's as knackered as I am :)

If you live in the UK and couldn't make it, why not? Actually, to be honest the 8-bit support wasn't as good as last year with fewer stands (FUTURA were missing, there hasn't been any sign of Tiger Developments for months - is he still operating, Raph? - and Gralin International have ceased trading a few weeks ago).

I have a confession to make .... I only bought one piece of Atari 8-bit equipment and that was a replacement XL for five pounds. The rest of the stuff I bought was cheap PC equipment, although I now have a spare drive that I could use with Micro Discount's new drive board. They have some plans to create compilation disks containing up to 10 pieces of software on a single 720K 3.5" floppy (you heard it here, folks).

They were also demonstrating a 130XE running the Creative Labs MidiBlaster sound module and it was incredible. I was allowed up close to it and I have to say that with one of these beauties you don't need a specialist wave table synth. Of course, I asked the inevitable question and the reply was yes, there was no reason why games couldn't be written to support it. The mind boggles :)

Um, unfortunately Menu Print wasn't available at the show because of problems with the manual, so I've got three more weeks to get it ready.

As I say, the show was pretty dull for Atari 8-bit users apart from Micro Discount's stand so I don't know how much longer it will be the focal point of Atari 8-bit users in the UK ... I do know that TWAUG intend to be at SAMS in april, though.

6344. Re: DIGITIZING SOUND

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-15 13:09:00 UTC
From: yhavinga@cs.utwente.nl
Message-ID: <3aabtc$925@utrhcs.cs.utwente.nl>
Source record: 97361

The lowest four bits of the 'audio control' registers of
the Pokey chip can be used to output 'volume'.

The Pokey chip has 4 audio control registes, one for each
channel.

Changing the volume fast (e.g. 15000 times a second) will
produce sound.

A complicating factor is that when samples are to be played,
the troughput of volumes, or play-rate, has to be constant,
and, more important, continuous.

So, NMI's, especially the vertical blank can be annoying.

When timing is not done using NOP operations in the play-
loop, but e.g. using WSYNC, a lot of problems are already
avoided.

But, you should read the 'Mega Megazine', a disk magazine
by programmers, for programmers. It is english, though
most writers are european. It is distributed by
A.N.G. software, Holland.

The address can be found in a faq (faq2.txt?) on atari.umich

Ofcourse that is possible

> I know it sounds 'strange' but it would be quite good fun to be able
> to open up a process running on an XL card and run it at the same
> time as other progs.

It doesn't sound strange, but maybe the advantage of having the XL
connected to the Falcon isn't that you're able to run programs
concurrently. You can already do that, unless you have two monitors.

Accessing a hard drive in the Falcon from the XL will for example
be a great gadget for programmers.

Which one? There were at least 2, maybe 3.

I used to have a 1020 plotter that printed 40 col in the default text
mode, and an 820(?) thermal printer that printed 40 col.
It's those unusual and cheap old Atari printers that make me want an
interface that would let me attach one to a standard parallel port
(like on my HP workstation at work -- that'd be cool :-)

I think I sold them, but I'll check.

nonsense. Most WWW sites have textbased menus and clickon pictures.
Using Lynx I can download these to the shell and then to the Atari. As
long as they are .GIFs or .WAVs, the Atari can view and play them in some
way. Is it fast? No. Is it 'as good'? No. But it is untrue to assume
that you can't navigate the WWW unless you are running a true GUI like
mosaic.

>still operating, Raph?
Sadly the answer to that one is yes. Last show Tiger Developments went to was
AMS 7, since then Neil practicaly gave up on Tiger Dev. There are many reasons
behind the decision, including lack of user support, work pressures, he had
to move house and was planning on doing so again in the near future... meaning
address changes and the possibility of lost mail... as well as several other
reasons. So Tiger Developments has disapeared as a label. However the
software still exists, and as far as I know Neil is still coding and very much
into the Atari 8-bit. He has been talking about selling the programs to
someone else to distribute... but everytime I hear from him he says he hasn't
"got round to it yet". In fact due to my long holiday I haven't heard from
him since about May this year, so I'm not exactly up to date on all the lastest
news!

6364. Ice-T and FlickerTerm Reviewers Wanted

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-16 14:35:43 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2ECA18E5@POST0.LAAFB.AF.MIL>
Source record: 97377

I sucked the recently released version of Ice-T down from umich via the GEnie Internet Roundtable and posted it in the 8-bit library sections of GEnie and CompuServe last night. (Itay, just keep the IRCs I sent you to mail me a disk. The GEnie/umich connection worked just super!)

Is anyone interest in writing reviews of either program for Current Notes? If you are, contact me via email and I'll let you know what's involved. (Winston Smith appears to be quite knowledgeable on Ice-T, based on his posts. <grin>)

6365. MidiBlaster Information Wanted

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-16 14:40:12 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2ECA19F6@POST0.LAAFB.AF.MIL>
Source record: 97374

Dave Davies recently mentioned:

"They were also demonstrating a 130XE running the Creative Labs MidiBlaster sound module and it was incredible. I was allowed up close to it and I have to
say that with one of these beauties you don't need a specialist wave table synth."

The TWAUG people sent me a audio tape of it by Darek Fern and it blew my socks off. How does one obtain more detailed information on availability, price, ordering information, requirements and capabilities?

Sounds like an article or product announcement is brewing for Current Notes. Darek, if you see this, please contact me or post here.

>Thanks, but how do I unencode it? My standard UUDECODE program
>doesn't recognize the data.

It's not UUencoded, it's bin64. He posted it from his Windows PC
as a "MIME file inclusion", so you need a MIME-capable mailer or
newsreader, or something else that can understand bin64, to decode it.
I thought the Unix mailer I use could do MIME, but it didn't recognize
the multi-part format. I'll try it from my home machine tonight.

I could be wrong, but as far as I can tell from the post, it's the
same thing that's on atari.archive.umich.edu as 8bit/xf2/xf25.zip, so
if you can ftp to there you don't need to worry about decoding the
posts.

BTW, the two easy ways to recognize a uuencoded file are:
1 - first line has a filename and a 3-digit number such as '644'
2 - each data line starts with 'M'
If you don't see these, it's not uuencoded.

In a previous article, krishna@max.tiac.net (Glenn M. Saunders) says:

>
>I think that 80 collumn refers to a different horizontal scan rate which
>standard composite color monitors do not reach.

The first thing I attached my XEP80 to was my Magnavox 40 column color composite monitor (no separate chroma/luma). You have to set the display dimensions smaller since the XEP80 generates a "larger" picture, but this particular monitor could handle it. Of course, the characters were so fuzzy that they were barely readable, and soon after I bought my 80 column mono monitor (another Magnovox).

>Does anybody have specific information about FTE products like MARS 8
>etc.? What is MARS 8 exactly? What other hardware products have they
>released yet? Are they currently working on new hardware? How much will
>they cost?

The following will be the press release from FTe about MARS 8 posted here
on comp.sys.atari.8bit last spring, and made available ever since on the
Cleveland Free-Net Atari SIG.

More recently, FTe announced the MIO II, an IDE interface.

Fine Tooned Engineering unveils MARS 8 Project
Date: 25 May 1994 16:31:38 GMT

4/28/94

PRESS RELEASE

Fine Tooned Engineering
unveils MARS 8 Project.

FTe will be introducing a "new"
product for the Atari 6502-based
800XL's that is simply "out of
this world". The MARS 8 has been
described as an all-in-one "wonder-
board", that has had well over two
years of R&D invested in it's making.

Once installed, you won't ever need
to peek "under the hood" of your
800XL again. This enhancement will
allow your Atari 8-Bit to have more
memory than a Mega4! The memory has
an option for battery backup and may
be used with 256K, 1MB, or 4MB SIMMS.

We even threw in SpartaDOS X, The
R-Time 8, MAC/65, Action!, Basic XL,
and Basic XE, just so you can show
your friends the "raw power" that
these machines are capable of!

The price structure and availability
is as follows.

The MARS 8 Project
(for 800XL's only)

Level Options Avail

"Galaxy The MARS8 board May 94
Plus" w/ SpartaDOS X
R-Time 8
$139.95 Basic XL w/TK&RT
& 256K (exp to 4mb)

"Cosmic MAC/65 w/TK Jun 94
OSS" Action! w/TK&RT
Basic XE
& Toon-a-Matic (c)
add $69.95 Option

"Stellar X-press! Jul 94
Sysop" D-Ram Battery Bkup
& Toon-a-Matic (c)
Option
add $79.95

"Twilight All of the above!
Zone" complete with Aug 94
easter eggs...

$249.95 (everything)

Order a "Galaxy Plus" before
5/31/94 & recieve a "Cosmic
OSS" upgrade voucher towards
the "Twilight Zone" model.
(which will be released 8/94)

The $139.95 for the Galaxy Plus
is an introductory offer. We
have "working" prototypes, and
these little beasties are "costly"
to manufacture. Due to the unique
nature of the MARS 8 Project we
have decided to release it early,
without any idea of how many of
them to produce. We are commited
to this price until 6/1/94. This
is a very "cool" product, and we
hope that the Atari Community feels
the same. We will offer a 30 day
money-back guarantee on this first
run of boards, knowing that once
you plug it in, you won't want to
take it back out! It would have
been nice to have this product
"reviewed" by a magazine such as

Current Notes, but we will be
shipping the first boards at the
end of May. (which means July issue)

All prices and features are subject
to change, as we have REALLY gone
out on a limb to let everyone know
what's happening...

As far as the SpartaDOS 3.2f
SHAREWARE is concerned, people have
been at two extremes. One side
which is complaining about "no code"
being modified and/or SpartaDOS
ownership conflicts. While the
other side has balanced out all
the "bad vibes" from the first group.

FTe is commited to doing everything
that we can to keep the end-user
as happy as possible. It should be
obvious that a tremendous amount of
energy has been placed with getting
the MARS 8 Project off the ground.

We are simply going to get this
Project finished and out-the-door
before any significant amount of
time will be spent on SpartaDOS 3.2f

Hopefully, it will do well enough
so that a few more people can be
put on staff, to get even more
"cool" products out so that we can
put a few more people...

(I think you get the idea!)<grin>

On that note, I hope everyone enjoys
this "no code modified except for
copyrights" SHAREWARE release of
DiskRX version 1.9

Mike

"Just your normal?
8-Bit kinda guy"

Fine Tooned Engineering

PO Box 66109

Scotts Valley, CA 95067

(408)Get-REAL
(438-7325)
or

Message-ID: <3ads5s$9hi@usenet.INS.CWRU.Edu>
Source record: 97384

In a previous article, mrathwel@uoguelph.ca (Mark Rathwell) says:

>Any opinions on Atari's DOS XE? Just seeking some info to satisfy my
>XF551 curiosity.

I kinda liked it. The interface is rather neat in that you always had menus to work with, yet if you know the commands ahead of time you can enter many selections at once. Using that same "command language" DOS XE supports batch files. Also file date (but not time) stamping, and of course complete support of DS/DD high-speed operation with the XF551.

Some of the drawbacks. It requires an XL/XE so it can use the memory under the OS, its unique disk format isn't supported by anything else, and the DOS 2.x support isn't nearly as seamless as it first appears. Plus, nobody uses it! (seemingly)

I gave up on it when I got MYDOS, which in turn I stopped using for the most part when I bought SpartaDOS X.

Also of note is that NONE of the 3 sector boot loader programs like
ATARI ARCADE will work the XF 2.5. Almost all my games have been
unprotected to files and must be loaded with a boot loader instead of
DOS. Though it will boot the disk as give a menu, it will not load any
of the programs.

6383. Atari Lynx 16-bit color portable for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-16 22:15:17 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.840.2ECA8475@getty.onu.edu>
Source record: 97285

I have a complete system. It is an Atari Lynx, 16-bit portable gaming system. It has a color LCD screen, with an electroluminescent backlit screen, so you can play it in the dark, wherever you go. It works with 6 AA batteries, or you can run it off of a 9v ac adapter.
This system has stereo sound. It is also a 16-BIT system, not 8-bit like the Sega Game Gear. I guess you could say that it is like having a portable Genesis with a screen. There are over 70 games available for the Lynx, and more coming out. You will find favorites like Ms. Pac-Man, Joust, Quixx, Ninja Gaiden, Lemmings, and a lot of others I can't remember offhand. There are some new ones as well, like Desert Strike, from Electronic Arts. Most of these games are available for around $20 each, from Atari or other mail order places. I will give the related phone #'s to whoever buys the system. In case you are wondering why I am only selling one game with the system, it is because I now have two! (I will need the rest of the games for my Lynx II) Oh, I almost forgot - the Lynx is the only portable game system that is designed to work with either left or right handed individuals. It has a double set of controllers, and with a push of a button the screen flips upside down (or rightside up, depending on your point of view) and you can enjoy playing left handed with the 2nd set of buttons. This isn't all that important to those of use who are right-handed, but I just thought I'd let you know.

Keep in mind that a Sega Game Gear, which has a smaller screen, (and is only 8-bit) costs $89 without a game, and $119 with a game. I would like to sell this system for the highest bid I get in the next 10 days. If I get a really good bid within the next few days, I may simply end the sale right then & there, because I don't really like auctions much myself. I would also consider trading the system for about 4 OEM CD games, but you would probably have to be a dealer or at least have access to a good selection to be able to get the ones I want. If interested, e-mail me.

I am including:

The Atari Lynx 16-bit base unit
6 new alkaline batteries (batteries included, wow!)
ac wall adapter, to use when you are near a wall outlet
and a free game of your choice!
(pick one from the following list)

Gates of Zendocon (shooter) This game has over 50 different levels! You can get power ups, have side shooters, etc. My favorite is the flying eyeball that shoots fire!

Rampage (the classic "monsters smash up the city" game) This has the original 3 monsters, plus another mystery monster you can play!

Gauntlet III (explore the dungeons, get the keys, fight hordes of ghosts, giant scorpions, the undead, etc.) This one lets you be the wizard, warrior, valkyrie, punk rocker, nerd, cowboy, pirate, and several others. Each has different attributes.

Well, Eudora for Windows is supposed to be MIME-compliant, but it
didn't seem to know those were MIME messages. That could have
something to do with my attempt to edit the headers to keep the
original header info, but I'm pretty sure I did it right.

So unless your newsreader understands those posts as a multipart file
inclusion (apparently WinVN does), just ftp the thing from the
archive. It's less painful.

6390. The Atari 8-bit Omnibus

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-17 04:50:26 UTC
From: tdrake1@umbc.edu
Message-ID: <3aenei$sn6@news.umbc.edu>
Source record: 97392

I just received my copy of "The Atari 8-Bit Omnibus". There are some 24 pages, plus inside front and back cover, just loaded with Atari 8-bit products and services. It is very well done, and has quite a range of offerings. It is printed on stock very similar to the "new" Atari Classics.

There were some vendors I hadn't heard from or seen in some time. Quite a few were completely new to me. It was nice to see that there really are a number of vendors out there still supporting the 8-bit.

Basically, David wrote to everyone listed in the Vendors and Developers list maintained by Michael Current. He offered free ads to anyone who was still supporting the Atari 8-bit. There are many vendors some of us will recognize, but there are some selling stuff from Australia and Europe, etc. and many of the overseas vendors have U.S. distributor addresses, for those who net from the U.S., that I had not seen before. There are even a few vendors in the U.S. I had never heard of!

The Atari 8-bit Omnibus was edited and published by a David A. Paterson and is only $5. His address is:

Atari 8-bit Omnibus
P.O. Box 342
Cote-St-Luc, QC H4V 2Y5
Canada

If you want one, you can make checks or money orders in the amount of $5 (U.S.) payable to David A. Paterson.

If you want more information about "The Atari 8-bit Omnibus" you can contact David at: D.PATERSON2@genie.geis.com

Check it out!

6396. PC Xformer 2.5 is up at UMICH's FTP site!

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-17 15:51:51 UTC
From: KENDRICK@sonoma.edu
Message-ID: <941117075219.26e12f98@sonoma.edu>
Source record: 97208
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

PC Xformer 2.5, the free version of the Atari 8-bit emulator for IBM PC's, has been uploaded to the U. of Mich. FTP archives.

It requires a 286 or better and 320 x 200 x 256 graphics. It emulates an Atari 800XL and Atari 800 with or without BASIC. Sound, printer, modem, joystick, Player/Missile Collision detection, and a few other things are NOT supported in 2.5, but for $29.95 you can purchase 3.0, which emulates an Atari 130XE WITH the above support as well as 320K RAM (it also includes a 40-page printed manual and a lot of free Atari 8-bit software). (Note: 3.0 requires a 386 or better).

The site's name is: archive.umich.edu (also try mirror.archive.umich.edu)

The file's path is: atari/8bit/Xf2/xf25.zip (approx. 180k ZIPped)
~~~~~~~~

For details, see the file xf25.txt in that same directory, the Atari 8-bit Newbie / Stupid Questions / Emulator Help F.A.Q. (xf2faq.txt), or the documents within the ZIP file.

To order version 3.0 of PC Xformer (or GEMulator, the Atari ST emulator (software/hardware combo)) from Branch Always Software, contact them at:

Branch Always Software

I tried running XFormer 2.5 on an IBM 486 DX2 machine with 4 Meg RAM
and all it did was lock up my computer. It didn't even try to show that
familiar Blue "READY" screen.

any suggestions?

And questions:
1) Does it really run M.U.L.E.? Really? Is it fast enough? How
are the graphics?

2) What is this player missle collision detect thing that doesn't
work properly? What does that encompass 8-bit software-wise?

thanks.

Make sure you have the .ROM files in the current directory when you
run the program.

> And questions:
> 1) Does it really run M.U.L.E.? Really? Is it fast enough? How
> are the graphics?

I haven't tried it.

> 2) What is this player missle collision detect thing that doesn't
> work properly? What does that encompass 8-bit software-wise?

Just about any games for the Atari use PMG and the collision
detection. Collision detection is a fast and easy way for a program
to find out if a player/missile is touching/overlapping another
player/missile or the background (playfield).
When it doesn't work, you can shoot right through your enemies -- and
they can never kill you. Doesn't make for much of a game, though.

I don't think that Derek has access to e-mail. He has got a fax
number if you're interested, though. Let me know and I'll dig it out
for you.

From what Derek told me a couple of months ago, he's not planning on
actually building any devices to hook up a MidiBlaster but rather
just give others the info they need to hook it up themselves. He may
have changed his mind after the response he probably got at the show
so you'd better fax him (a bit cheaper than getting dragged into a
long telephone conversation, I reckon :)).

I was lucky enough to be allowed round the other side of the stand at
the show to see the MidiBlaster and his drive board at close hand.
The MidiBlaster is a standard Creative Labs unit which was hooked up
to a hi-fi amp and a 130XE. It's not cheap, though. We reckon that
it'll cost anyone who wants a setup like this a minimum of 250
pounds. The amp isn't really required, I don't think, and I reckon a
pair of decent PC speakers would do the job.

Mind you, just think of the gaming possibilities !!!!

Anyway, Rick, I reckon you'd best contact Derek for the latest info
since some of what I've been told is months old ...

MULE boots up just fine until the intro screen. You can choose your
character and stuff, but when it comes to load the 2nd part the programme
returns to the intro screen. PC Xformer still has some disk handling
problems. I reported that to Darek, but haven't heard anything from his
side yet. BTW, the graphics of MULE look cool! If Darek took his time to
remove that bug, all of us could play MULE on our PC!

>I just downloaded it using gopher, so it is there. icet.arc, 66k,
>dated "94-10-32". (I didn't know October had 32 days!)

I haven't confirmed it in this case, but they noticed the same sort of thing over on comp.sys.atari.st. I guess the Gopher server at Merit/UMich is being a little wacky, 'cause they said when you look at by FTP all the dates make sense.

I got it from there too, just haven't downloaded to my Atari yet. (One of these days!)

>mode, and an 820(?) thermal printer that printed 40 col.

The little 40 column thermal printer is the 822.

There's also the 40 column 820, which looks very similar in shape to the
810 disk drive.

I tried d/ling all the files again, and erased the old ones, and it
does the same thing. Either locks up the computer or reboots it. I've
tried taking everything out of the boot to make sure there aren't any
memory conflicts, but that doesn't work.

All the .ROM files are right there in the same directory.

>I have a very simple ;) question: how many ATARI 8bits have been sold
>worldwide? Does anybody know?
>
>Ulf

Ulf, you have just assigned yourself a project (there is a lesson in this,
never "volunteer" by asking a question <grin!>.

Contact Atari, or find production figures for various models
(400/800/XE/XL), then take it from there.

A conservative estimate is at LEAST 100,000. How many are still in use,
however, is a different matter.

What about it, if you don't get a reply, would you like to give it a shot??

From: F Tooned <ftooned@delphi.com>
Message-ID: <JC-XEJg.ftooned@delphi.com>
Source record: 97222

It's been a busy summer!!
The August/Sept issue of Current Notes announced a delay
with the MARS 8 release because 65816 Processor was being
added.
The "Sweet 16" board is the result of that extra development.
The "MIO II" also happened... (almost by mistake), and it's
been coffee and doughnuts (and Domino's Pizza) here at
FTe 20 hours a day since late August!!

The "Sweet 16" and "MIO II" will be shipping before Christmas,
and hopefully I will be able to take a short break and get
some REAL food over the holidays...

Any more questions will be cheerfully responded to. Mike

On Monday, November 7, 1994 at 08:44:47 PST (2:44pm GMT ?)
Rick_Michael_Cortese@cup.portal.com (Rick Cortese) wrote:

RC> What language are you working in? Loading sectors is almost trivial
RC> on an Atari since the routine is located in the OS ROM.

What language would you like me to work in? ATARI BASIC and
TURBO BASIC would be best, because I don't have to go digging through piles
of stuff, but ATARI ASM, ATARI LOGO, ATARI PILOT, FIG-FORTH (not FORTH-83),
ACE C, CC65, DRAPER PASCAL, would all be fine. I do not posess either
ACTION! or MAC/65, though.

I understand that it is just a CIO call of some sort. I tried a quick
program from CHADWICK'S "Mapping the ATARI", but it crashed my 800XL. As I
was doing something else at the time, I didn't pursue it further. I am
used to working in fullscreen HEX editors (such as PER and XEDIT on an IBM
370, and I think they call it "DISKASM"(?) on the ATARI 8-bit), but that
usually involves just twiddling bits in place. This is the first time that
I have to upload a DOS-less boot image onto another machine. I heard a rumor
that someone wrote a UNIX utility to uncompact atari DISKCOM archives into
a data image? I had thought about just going into the back issues of some
magazines and converting a disk HEX dumper program. UUENCODE would be
nice, except that I think that requires DOS. The Infocom interpreters,
ITF, ZIP and INFORM(?), require you to upload the database off of a game
disk. As I am at a bit of a loss as to the best way to accomplish this,
any advice which you could give would be most appreciated. Thank you.

6414. Atari XMM804 Printer

Hello world, after an absence of just over four months I'm back with
an e-mail account. My support for the Atari 8-bits has been continuing
and I have some new products for you. Read on for some brief details
and keep your eye on future digest mailings for the full details.

NEW NEW NEW NEW NEW NEW NEW NEW NEW NEW

GTRACKER A sample sound sequencer program for Replay/Parrot
compatible sound files. Digitise your own sounds and sequence them
into a song file. Twin disk pack with several demo files, a player
program and a printed manual.

Price: #6.50 ($15) including shipping.

SUPER PRINT-LAB XE A new graphics design and print program for
use on 128k (or more) machines. Features include the usual array of
art tools, extensive support utilities and printer support for Atari 1029,
Atari 1020 (in full colour) and Epson compatibles.

Price: #6.95 ($16) including shipping.

Other titles:

JAWBREAKER #4 ($8)
MOUSEKATTACK #4 ($8)
Buy both Jawbreaker & Mousekattack for only #6.95 ($14)

ARENA #5 ($10)
BUBBLE ZONE #5 ($10)

ADDRESS:-
RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH,
DONCASTER, DN5 8BW, ENGLAND

E-mail: chmrig@leeds.ac.uk

Watch this space for more products and more details.

6416. Re: HOW MANY HAVE BEEN SOLD???

In article 1oL@osuunx.ucc.okstate.edu, coonj@osuunx.ucc.okstate.edu (Jeff Coon) writes:
> Does anyone have the GEMulator for the PC?
>
> If so, two questions for you:
>
> 1) What's it like?
>
> 2) Is it worth it?

Well, methinks this question best belongs in the comp.sys.atari.st
newsgroup but since you asked...

The Gemulator works very well indeed as long as you remember that it is,
in fact, an _emulator_ and therefore will not do _everything_ as well as
the 'real' thing. But it's a very good effort, IMHO. Compatability is
quite good, ease of use is superb, and on a fast PC it's very usable.
It is NOT the best solution for games or MIDI software, but does a quite
respectable job on most everything else. Besides... it's a neat hack. :)

Is it worth it? Only you can answer that. Since used Atari ST hardware is
dirt cheap nowadays, it might not represent that much of a cost savings.
But it will certainly save you deskspace being 2 computers in one, essentially.

For more specific info, contact the author directly at darekm@microsoft.com.

-Hutch- @ Fair Dinkum Tech

>"The best way to accelerate a Macintosh is at -9.8m/s/s"

While I may disagree with this witticism, I must admit it's a cute one. :)

>other groups, I put up a posting and someone responds within hours. In
>this group, posts go unanswered for days ... sometimes no one responds.
>Even to questions that aren't difficult. Very strange.

While it's unfortunate you don't always get answers to your questions, you
should realize that such responses are generally directly proportional to
the amount of traffic a newsgroup receives. Or perhaps your questions have
not been stated clearly or have been non-specific or too-general or... ?

Anyway, don't give up on the group as there is a lot of 8-bit knowledge and
experience encompassed here. I generally don't respond to such queries as I
no longer consider myself up-to-date on the 8-bits and there are many others
here much more qualified than I to give a better answer. As a last resort
you might try emailing a few individuals for help if the net fails you.

So come on Atarians... help each other out. Goodness knows no one else will. :)

-Hutch- @ Fair Dinkum Tech

6420. Re: GEMulator?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-18 17:01:47 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <127544@cup.portal.com>
Source record: 97231
Body handling: HTML body converted to readable text

One of my friends has one & he thinks it's the greatest thing since sliced bread. One of the things he's highest on is the ability to change screen rez without the computer doing a reboot. All rez's are available from a standard VGA card so no need for Monitor Masters etc. He also likes the speed improvement he got with a 486 .

6421. Re: Atari Lynx 16-bit color portable for sale!

Sorry! No sale BUT.....

Daniel Woodard (SA073@getty.onu.edu) wrote:
: I guess you could say that it is like having a portable
: Genesis with a screen.

You could, but you'd be lying ;)
Actually, for a handheld, and considering when it came out, it's *very* good.

: It
: has a double set of controllers, and with a push of a button the screen
: flips upside down (or rightside up, depending on your point of view) and you
: can enjoy playing left handed with the 2nd set of buttons. This isn't all
: that important to those of use who are right-handed, but I just thought I'd
: let you know.

Well, I'm right handed, and I find it much easier to play upside down. I
always feel that most controllers (Lynx's included) have the pad and buttons
the wrong way round for right-handed people (although I've never heard anyone
else complain), but the Lynx is the only one that lets you "correct" this
if you want.

BTW, my brother has a Lynx, but it's faulty, it's like it thinks the joypad
is constantly moving in one direction (left I think), this is reversed when
you trun it upside down (like above).
It's been like that for years now, when it first
happened he got my Dad to look at it, but he couldn't see anything wrong.
Is is a short circuit somewhere- is this a common problem?

Graeme Fenwick gfenwick@mcs.dundee.ac.uk

>character and stuff, but when it comes to load the 2nd part the programme
>returns to the intro screen. PC Xformer still has some disk handling
>problems. I reported that to Darek, but haven't heard anything from his
>side yet. BTW, the graphics of MULE look cool! If Darek took his time to
>remove that bug, all of us could play MULE on our PC!

I've tried MULE on it. You can get to Irata, but only at original speed.
Once you see the ship, go back to fast. And that isn't fast on my 486/33
with crappy DOS-mode VGA card (great Windows speed, though.)

I got through the Land Grant, outfitted a MULE, and installed it.
But you can't re-enter the town! Related to collision detection.

Message-ID: <89DF451.08310002B4.uuout@cccbbs.cincinnati.oh.us>
Source record: 97080

The release of 2.0 PCXformer was enough to get me to order 3.0. It alone proves it can be done right. Why not give its author some incentive and go ahead and order it? I don't believe in supporting bad software, but Branch Always has released some very good stuff. I'd like to see some positive postings around here for a change.
The fact is, that in this area (Atari software), some appreciation may be even more incentive than the financial gain. For a good programmer to continue supporting this platform, he has to have special dedication to the machine and the people using it. I purchased Xformer 3.0 and Gemulator as well as some earlier software and I have never regreted a purchase. Great Work Branch Always!

6424. Alchemist Returns To AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-18 23:43:17 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411182343.AA054412179@relay2.geis.com>
Source record: 97236

For those of you who were glad to see the first publication of the New AC a few weeks ago but bemoaned its lack of substance, help is on the way. :)

The 8-Bit Alchemist has once again fired up his soldering iron to do battle with the Murphy Demons. Hopefully my old Alchemist column will once again become a regular feature of the New AC. A manuscript is now nearing completion & will get sent off to Jim Hood probably next week, with fresh subject matter now appearing in the pipeline for future material.

Should I say what the subject of this article will be?

Naaaahh, that would be telling.....

- Ben Poehland
The 8-Bit Alchemist

6425. Re: Xformer 2.5 is here!! - xf25_1.zip [0/3]

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-19 00:01:23 UTC
From: darekm@microsoft.com
Message-ID: <CzHMqD.3K3@microsoft.com>
Source record: 97069

Yes, please download PC Xformer 2.5 from the UMICH site. The person who posted the whole uuencoded file as two separate ZIP files was being stupid and not doing what I had requested. The whole file XF25.ZIP comes in ONE PIECE and the file size of the ZIP file is 188,416 bytes. The CRC on the XF25.EXE file within the ZIP is 74DA99C1.

DO NOT DOWNLOAD PC XFORMER 2.5 FROM OTHER SOURCES IF THE FILE SIZE IS NOT 188,416 BYTES, IF THE ZIP FILE HAS BEEN BROKEN UP, OR IF THE CRC DOES NOT MATCH!!

I do not want people tampering with PC Xformer 2.5 as some people did with PC Xformer 2.0 and then posting the tampered version. If you are worried about the authenticity of the ZIP file, email me and I will try to email you the file directly, although this won't work with everyone's email accounts.

Also, when you decide that yeah, PC Xformer 2.5 is pretty nice, but you'd like to upgrade to 3.0 so as to get full Player Missile Graphics collision detection support, real joystick support (great for games!), real sound, modem, and printer support, both TOAD COMPUTERS and B & C COMPUTERVISIONS (see ads in Current Notes and ST Informer) now have shrink wrapped copies of PC Xformer 3.0 in stock and for sale for $29.95.

- Darek, the PC Xformer guy

I noticed the same thing. I tried everything to get it to run. Even made a
new DISKCOM file without the batch file and it still refused to work.
Bummer!

Mark Rathwell <mrathwel@uoguelph.ca> writes:

>Any opinions on Atari's DOS XE? Just seeking some info to satisfy my
>XF551 curiosity.

In a word... DON'T! Use either MyDOS or SpartaDOS. Both support the DS/DD capabilities of the XF551 and are compatible with other DOSes in DD mode. DOS-XE is compatible with nothing but itself. Plus if you choose SpartaDOS version 3.2d or 3.2f you can patch the DOS to take advantage of the High Speed mode of the drive. It really flies! DD at SD speeds!

6429. Floppy Drives Available

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-19 02:08:10 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411190207.AA142880863@relay2.geis.com>
Source record: 97237

I noticed a few recent inquiries from people asking about floppies
for the 8-bit. I have a few I'd like to sell if anyone is
interested.

U/S Doubler 1050 drives- mint in the box w/all accessories, $55.
(Original Atari chips are included; these must be replaced for
repair or alignment purposes.)

U/S Doubler 1050 drives- no box or manuals, $45.
Power supply, SIO cable & original chips included.

Stock 1050 drives- no box or manuals, $35.
Power supply & SIO cable included.

XF551 Drives- mint in the box w/all accessories, $70. (only 2 to sell)

Might have another 551 to sell if I can ever the darn thing fixed.

Source record: 97241

```
If you're working with a single density disk, the DSKINV vector works
fine, I can't think of why the Mapping routines wouldn't work.
for D1: it should be as easy as:
10 DATA 104, 32, 83, 228,96
20 FOR N=1536 TO 1536+4
30 READ A:POKE N,A:N.N
40 POKE 769,1:REM DRIVE #1
50 POKE 770,82:REM R FOR READ
60 POKE 772,128:REM LOW BYTE OF BUFFER
70 POKE 773,6:REM HIGH BYTE OF BUFFER
80 POKE 778,1:REM LOW BYTE OF SECTOR
90 POKE 779,0:REM HIGH BYTE=>SECTOR 0
100 X=USR(1536)
After the USR() the contents of the sector will be in memory
from 1536+128 to 1536+255. You can also point the buffer to
the address of a string as long as you've already dimed & assigned
a value to the last character.
```

From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2ECCBC7C@POST0.LAAFB.AF.MIL>
Source record: 97246

Jim King was complaining that Ice-T was not at umich. It is. I requested it through the Internet RT on GEnie. (Itay had sent me the path.) I have uploaded Ice-T, the program, to GEnie. (icet1.arc) and to CompuServe (icet.arc). The reason it's icet1.arc on GEnie is because Jim King already used that file name in the GEnie library for some reason awhile back.

So, it there Jim. Just keep looking.

I think I may have a reviewer for both FlickerTerm and Ice-T for Current Notes. (Kent Johnson and Dave Paterson) It wasn't clear to me whether Kent Volunteered to do Ice-T or something else though, so if anyone is interested in getting their name in print, re: Ice-T, please send me a note.

>Hi!
>
>I have a very simple ;) question: how many ATARI 8bits have been sold
>worldwide? Does anybody know?
>

From The American Banker, November 5, 1982:

"Mr. Cayne said 240,000 Atari 800 computers are sold a year, and Mr.
Curtis adds that Atari said 90% to 95% of the manufacturers' New York sales
are at Christmas time."

Based on this, I would say there were approximately 2 to 5 million sold. Of course, the sales figures undoubtedly changed with time, especially with the advent of the relatively inexpensive XL line. But the sales figure of 100,000, which another poster reported, is clearly incorrect, since this is less than the 1982 yearly sales.

I think industry statistics would be available on this kind of thing, but it would take some digging (and no, I'm sorry to report I'm not volunteering!)

>
>Thats nice, but why dies everything except 'the sawn demo' refuse to run,

Steve, it is an absolutely false statement to post a message that only swan demo runs on PC Xformer. C'mon, you know better that to post something stupid like that. I think most people here on the net have had a chance to try PC Xformer and will tell you it runs a lot more than just the swan demo.

There are a large number of programs that you will only be able to run on PC Xformer 3.0, due to 2.0 and 2.5's lack of real player missile graphics support. I have explained that time and time again.
2.0 and 2.5 are versions similar in power to the Atari ST versions of ST Xformer 2.0 and ST Xformer 2.5, which also did not support player missile graphics. The free versions of PC Xformer are meant to get you interested in upgrading to the 3.0 product, which does implement all the features advertised. If you're the type of person that tries to mooch off free demos instead of ever paying for software, well, then you will have to live with the limitations. Or you can join the 200 or so people that have purchased PC Xformer 3.0 so far.

By the way, don't get me wrong. I'm more than willing to fix any legitimate bugs in 3.0. Just reprot them to me directly instead of posting bug reports buried deep in internet postings hoping that I'll trip across them. 2.5 fixed a number of bugs that people reported about 2.0. There won't be another free release, so all bug fixes will be made to 3.0 and as with Gemulator, registered users will be offered periodic free updates for bug fix releases and low cost upgrades for major releases.

6450. New Standard

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-20 05:40:18 UTC
From: b.poehland@genie.geis.com
Message-ID: <199411200540.AA273550012@relay2.geis.com>
Source record: 97258

A little belated, but I'd like to add my thoughts on the proposed idea of new standards for 8-bit usage.

First, it's a great idea. I've wished so many times all old software could be upgraded for 256K machines-- which for me would be the most minimal standard. Also that print graphics could be made for 24-pin printers.

Second, there's not a snowball's chance in Hades it will ever happen. The community is too fragmented. The few active developers left don't have the resources to enforce the standards. Too much of our software base now comes from the user community itself-- & many of those people have only minimal systems. You can't develop a PD or shareware prog that makes use of XE memory or better on a 64K machine.

Although many users have souped-up hardware, I believe those people to be a minority. Probably most users who are sophisticated enough to read this newsgroup have advanced systems. (I'm logged on right now with an 800XL based system w/1-meg RAM, 44-meg removable hard drive, XEP-80, & four 1.44-meg floppies. I doubt there are 50 other users with comparably advanced systems.) Time & again I see posts here from folks who seem to feel the people who are on-line ARE the 8-bit user community. 'Tain't so!

Statistics show only about 20% of all computer users use their machines for telecommunications. My experience suggests that figure holds fairly true for the Atari 8-bit community as well. In other words, the great majority of users are not on-line, are relatively isolated, & have systems that are either minimal or only slightly upgraded. (I would hope that a 256K upgrade would be the most popular among users generally.)

It took a major effort among the Big Three of the IBM world to get standards for one relatively narrow item: memory management. Lotus, Intel & Microsoft all threw their weight into the LIMS standard for managing expanded memory in AT-class IBMs & compatibles. The small developers took their cue & folloed the standard as a matter of economic survival. But no such name-recognition exists in our community, nor are there any developers left who have a sufficient financual interest at stake to make it in their interest to adopt/adhere to standards. We just just don't have critical mass any more.

About the only standard I see existing are Atari's original guideleines for programmers (do's & don'ts regarding OS calls & stuff), plus the Atari DOSs. Even DOS 2.5 can't be a true standard, since dual density isn't recognized by many of the floppy drives still being used by a lot of people-- such as the old 810's. So the de-facto DOS standard (the DOS

you use as a common medium of exchange between users) is still basically DOS2.0s. Which is what, 12 years old? I really chafe at this (booting up AtariDOS on my system takes me back to the Stone Age), but there is nothing to be done about it. You just can't force eveyone out there to upgrade their systems to some minimal standard of RAM, printer, DOS, floppy drive, etc.

Even if you could find them all-- which you can't.

- Ben Poehland

6452. Re: New Standard

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-20 06:44:38 UTC
From: krishna@max.tiac.net
Message-ID: <3amr8m$1o9@sundog.tiac.net>
Source record: 97262

My reply to this is that if there are a lot of 8-bitters who are fragmented and essentially on their own, there is no way to distribute new shareware to them, nor is there a way to let them know about Atari Classics, etc... So they are essentially to be ignored.

The 'New Standard' would therefore be relegated to the online/usergroup community.

Here is analogy. The isolated 8-bit community is like the theorized dark matter in the universe. We know it is out there, but it is impossible to detect from our perspective.

Unless THEY find US, we can only treat them as though they do not exist.

There is no way we can, for instance, put a magazine on the racks for them to stumble over. If Antic or Analog were never on the mag racks I'd never have subscribed to them in the mid to late 80s.

If they don't get a modem and discover what support is left, like I did a few years ago, they will remain on their own, and odds are they won't remain with the Atari long anyway.

2600 Adventure for the Atari 8-bit computer, by Tony Ramos

With interest in Atari emulators now growing, and the progress made on emulating the Atari 2600 (Activision's upcoming product) and the 8-bit computer (Darek Mihocka's XFormer 3.0 for IBM compatibles), many people are hoping to see at long last an Atari 2600 emulator for the IBM PC.

Although hardly a solution, I feel it is time to present some work I did a long while ago: An Atari 8-bit version of 2600 Adventure.

Don't get too excited: there's no sound, lots of things are broken or just plain unfinished, and on a good day it's maybe 1/3 the speed of the real thing. However, I did manage to get the graphics and movement dynamics pixel- and frame- perfect, and even made room and data editors for constructing new worlds.

First, some background info: I'll try to keep this short.

I had my first encounter with the Atari VCS when I was perhaps 12 or 13 years old, and my mother visited a friend of hers whose children had one. One of the games they had was Adventure, which made such an impression on me I became fascinated with the possibilities of creating environments using computers.

14 years later, in 1986, I had just finished Parrot, a digital sound sampler for the Atari 8-bit, and was beginning the first year of my computer science degree. As a programming challenge, and in tribute to Warren Robinett's amazing work, I attempted to re-create 2600 Adventure on my Atari 8-bit computer. I videotaped several game sessions, digitized and slowed down the sound effects, and made many charts and graphs. Unfortuately my programming expertise was limited to Atari BASIC and simple assembly language routines.

And so, presenting the unfinished results of that effort. The executable, ADVNTRE1.COM, is Atari BASIC with M/L subroutines, compiled using A Basic Compiler. It loads the data file ORIGINAL.ADV, which contains all the room, object, and linking data for the kingdom. Also included are ROOMMAKE.BAS, a room editor; TABLMAKE.BAS, a room link editor; and DATMAKE.BAS which builds the final data file.

I have uploaded an archive containing these and several other files to atari.archive.umich.edu as ADVNTRE.ARC; the complete version of this post is included as documentation.

Have fun picking this apart...don't be too hard on me, I program much better now...honest.

I cannot help but feel that V2.5 should be diftched in favour of
a time limited, or reduced function V3. I have had quite a lot
of experience of selling the Spectrum emul, and you have to
balance those that bemoan crippleware, and those who never
believe a featire until they see it. I think XF2.5 errs on the
cripple side, and does not show the good bits, if they exist.

JIM GRAHAM (jim.graham@cccbbs.cincinnati.oh.us) wrote:
: The release of 2.0 PCXformer was enough to get me to order 3.0. It
: alone proves it can be done right. Why not give its author some
: incentive and go ahead and order it? I don't believe in supporting bad
: software, but Branch Always has released some very good stuff. I'd like
: to see some positive postings around here for a change.

Because emulating the 800 is one thing, and emulating an 800XL or an 130XE is a little bit harder. 2.5 can't even run one of the most popular DOSs available, SpartaDOS. 2.0 is a fine piece of work, and the emulation seems flawless, 99% of the software probably runs fine on 2.0, but 2.5 with the 800XL emulation it seems apparent that it can't run as much software as reliable.

: The fact is, that in this area (Atari software), some appreciation
: may be even more incentive than the financial gain. For a good
: programmer to continue supporting this platform, he has to have special
: dedication to the machine and the people using it. I purchased Xformer

This is probably true, I guess you would consider (this is not BA, it would be another company, and another emulator) $69.95 US a dedicated person also?

But I think that he (Darek) isn't really interested in the money, but feels he deserves some compensation, and I feel he is right.

: 3.0 and Gemulator as well as some earlier software and I have never
: regreted a purchase. Great Work Branch Always!

I heard Gemulator wasn't that great, but I have never tried it. What I can say is that I have used PC Xformer 2.0, and it is an excellent emulator, one of the better ones, a commercial grade emulator. But what I have seen of 2.5 is that it can't run my favorite DOS.

6461. Problems with DiskCommunicator

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-20 13:49:17 UTC

Message-ID: <nthewarapp-2011941349170001@nthewarapperuma.ea.com>
Source record: 97296

I'm having problems making disks using DiskCommunicator, I hope someone can give me some help!

I just got my Atari system going again after buying a 720k 3.5" disk drive at AMS allowing me to transfer files found on the Internet to my Atari.

My Internet Connection is via a Macintosh, so I FTP files from umich, put them on a 720k IBM PC disk, take them home, stick them in my Micro Discount 720k floppy and transfer them with Robert Puff's IBMREAD program to Atari disks. .ARC files transfer and de-ARC OK, but I'm having problems with .DCMs.

I'm running DiskCommunicator 3.2 (12/87), with verify on, I have formatting set to on, the program seems to read the files OK, formats the disks in my 1050 OK, and seems to write the sectors OK too, but the only .DCM I've managed to turn into a bootable disk OK is INTELB.DCM. All the other disks have just loaded 3 or so boot sectors in on bootup and then zilch.

.DCMs tried without success
---
big1.dcm
big2.dcm
halle93a.dcm
rayofhop.dcm
sweeta.dcm
fted32f.dcm
intela.dcm

.DCM tried with success
---
intelb.dcm

My System

Atari 800XL (PAL)
Atari 130XE (PAL) - tried both 800XL and 130XE, same results
Atari 1050 drive with Hyper Drive DD and Warp-Speed enhancement
(I've turned the Hyper Drive off, it doesn't seem to make any difference)
Micro-Discount 720k Disk Drive Interface and Chinon 720k 3.5" drive
(I've removed the interface from the SIO chain, it doesn't seem to make any difference)

DOS versions tried without success

MYDOS 4.50

SpartaDOS 3.2c

I hope someone can give me a tip, here...this is driving me nuts!

Thanks all!

Neil.

P.S. If you could email me any info as well as/instead of posting, as news takes about 5 days to get to our site.

Thanks again.

$.02, I've done a lot of disassembly of commercial software & a fairly common trick is to write values from $C000 to $FFFF. I've seen this done for both disk based & cartridged based software. I'm not sure which programs people are talking about not working, but it would be more useful if you named specific titles that didn't work. I believe Ultima IV is an example where they used both bad sector disk protection & the write to ROM protection.

Well, some things will be done just because they are obvious. For instance memory banking: There are no more pins left on port B so what has to happen is a new latch on the BUSS. The only thing that needs to be done is say where. I'm betting on $D380. If you add 8 bits of latch there you only have to cut/jump one pin on the mother board & you should be compatable with everything from an internal mod of a 400 to something hung on the PBI. I hacked my xl to have a 6520 there <No, I didn't use it for banked ram, too lazy> & hung a printer on it. If someone really wanted to go retro you could even add 4 joysticks, but I don't see that happening. If I would've been given the choice of the current memory hacking scheme or just adding a latch & leaving the exist built in BASIC etcetera alone I would have taken the latch.

Not hard at all. :) I do believe this has already been done for the PC.
I think it was done using a typical device handler to the drive which
was connected via the parrallel port on the PC. The catch is: It has
been done for LINUX. Shouldnt be too hard to get the source code and
port it to a straight MeSsy Dos program, maybe a TSR even.

From what I read in magazine reviews that was one NASTY word
processor. Braindead printing, you had to press RETURN for
each page while it was printing!

Every other program trounced it. I can't find the review in the
ANALOG index. Must've been Antic, not long before AtariWriter
came out. AW (and + and 80) were done by William Robinson and
Mark Riley at Datasoft.

There is a prblem, it would require a slightly different
interface. The 'command' line with SIO2PC can only be
controlled by the Atari. It would need different wiring
so the PC can control a disk drive.

The ST X-Former cable is the type you want. Darek said it is
possible to modify SIO2PC for this purpose, maybe use a switch
so you can go back to normal?

6472. PC Xformer 3.0 Documents

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-20 23:09:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3aokud$o7s@nic-nac.CSU.net>
Source record: 97277

In Vol.14 No.7 (Oct/Nov 1994) issue of _Current_Notes_ magazine, Atari 8-bit Editor and Columnist Rick Reaser mentioned that I wrote the documents to PC Xformer 3.0 for Branch Always Software.

This is true, but some facts have changed since that article was published. Due to the costs of printing, the documents to PC Xformer had to be scaled down a bit, but the scaling was 90% reformatting and font-shrinking.

_CN_ listed it as having 13 appendicies and a 16-page glossary... :) well, that was shrunk to 12 appendicies (which includes the glossary as appendix 12) and the glossary is about 13 pages long (6-point font) and includes over 450 entries!

It includes 7 major sections, one containing eight subsections, and subjects range from general things like requirements and setup, to details like Atari and MyDOS menu commands, the many ways of transferring files between Ataris and IBMs, the ENTIRE Atari ATASCII character set (including ture 8 x 8 graphical images (I've seen many books try to reproduce the Atari character set, and I figured >I'D< do the whole thing (rather than skip the textual ones and only draw the graphical ones) .. perhaps it was too much?! :)), error codes (for BASIC, TBXL, MyDOS, Atari DOS AND spartaDOS .. all in one list!), file I/O, editor controls, colors, graphics, and sounds, and even how to contact other Atari 8-bit users!

Of course, most people will use this info. only as reference material, but think of the non-Atari-guru folks who will find use in this stuff and perhaps end up hardcore Atari users, even though they don't HAVE an Atari anymore (or ever)!?

Oh god.. now I'm bragging.. sorry :) I didn't mean to, again my whole point for this was to correct the _CN_ article with updated information :)

anyways! I highly recommend PC Xformer 3.0 to all those out there who either can't bring their 8-bit everywhere or who just don't HAVE an 8bit anymore!

NOW.. I'm POSITIVE that 3.0 MUST have bugs in it. The XL/XE OS inclusion is a pretty NEW feature! It's BOUND to have bugs, but who CARES!? Wait for the free upgrades (be sure your REGISTER though!!!!!!!!).. it's not like Darek wrote this program, release it, and is going to vanish or something!

happy 8bitting! (either on your 8bit or on your 32bit! :))

Computers, Progress and Necessity

I've been doing a lot of thinking recently about computers. More specifically, I've been thinking about what computers are *for*. Why do we have computers at home? What is it that has prompted us to invest thousands of dollars in these boxes of silicon?

Before I lose you completely, I want to say that I've had a fairly lengthy history of computer use. My first computer was an Atari 400, which I received as a present in 1982, at the age of 13. Through the years, I've gone through a 1200XL, an Apple //c, and several models of MS-DOS boxes. The point is, every time I purchased a new computer, I spent more money than the previous time.

A few years ago, I returned to my first "hacker" machine, the Atari 8-bit. I've kept the MS-DOS boxes around for certain tasks (more on this later).

Since I spend most of my computing time (outside of work) on the Atari 8-bit these days, it has made me wonder whether anything else is necessary, and if so, for what application(s)?

Generally speaking, there are three broad categories that computer usage can be divided into: programming (a dying art), using applications, and gaming. What follows are my experiences with these tasks.

I thoroughly enjoy programming the Atari 8-bit. I have books that tell me what every single byte in the computer's memory is for. With effort, I can coerce the machine into doing some really great things. Additionally, I'm thoroughly comfortable with it as a programming environment.

The applications I use include word processing, spreadsheets, data bases, and telecommunications. My Atari can do all of these things very well. I am completely at home in AtariWriter Plus, SynCalc, SynFile+, and BOBTerm. Each of these products fits my needs completely.

The final category I mentioned is games. I don't think much needs to be said here, beyond asserting that the Atari 8-bit is the ultimate gaming machine.

Total cost of my 8-bit system, including the software to do these things, is less than $200 at garage sales, flea markets and here in the USENet.

Now that I've shown you all how well this low-cost machine fits my needs, perhaps you begin to see what I mean by the questions I posed in the first paragraph. Why do I have an

MS-DOS box?
Well, one of my MS-DOS machines is used by others; it is a BBS machine. I find that environment to be the most conducive to good BBS activity.
Another of my MS-DOS machines is reserved for producing high resolution color printouts, as well as professional quality desktop-published written material. Many of the color printouts are the result of scanning in images, retouching them, then printing them out.
Now, the above-described are examples of activities that the 8-bit is not suited for. However, how many people really have a need to do that stuff? Is it worth $1500-$3000 to put a system together for that? No, not to most people. (By the way, my BBS machine is a 286 with a monochrome monitor. Not exactly state-of-the-art, not expensive, and it runs my highly-regarded BBS perfectly.)
The truth is, most people would be able to get their work done with an unmodified Atari 130XE, a good-quality color monitor, an 850 interface, a couple of disk drives, and any of the currently produced high-quality/low-cost printers and modems. But, would they be happy?
No, they would not. Not unless they could rise above the advertising which convinces us we "just gotta" have the latest equipment, which performs at levels faster than the supercomputers of a decade ago. Oh, yes, we must have all that power, so that we can be more productive! (And, of course, play Doom.)
The above paragraphs are an attempt to answer my first question, which was "why do we have computers at home?". Most people own computers so that they can play games, word process, telecommunicate, analyze spreadsheets, and/or create databases (probably in that order of popularity). A few people do the heavy-duty, high-end tasks such as scanning and manipulating images, producing professional-quality desktop publishing work, designing with the aid of a computer, etc.
The second question, "What is it that prompted us to invest thousands of dollars in these boxes of silicon?", is easier to answer: Techno-lust. Yes, techno-lust, induced by the myriad of images screaming out from our televisions and radios and leaping from magazine and newspaper ads. Advertising has created a market where none should exist. Ninety-nine percent of the computer-owning population has a computer on their desk that is too powerful for their needs, by a factor of at least 10.
Yes, I know, once a year you use your Mac Quadra 850 to produce a holiday newsletter of family happenings which you send to your friends and relatives. Looks great, doesn't it? And aren't your the recipients all impressed with it? (Ha! They probably toss the irritating thing with the junk mail!) But is your computer's true power used often enough to

justify the power and the price?
No, we don't need these over-powered behemoths. That once-a-year newsletter could be produced at the local Quickie Print. It could even be produced on your Atari 8-bit. It might not have all those nifty clip art images, nor the fancy formatting and fancier fonts, but it would still get the job done.
My conclusion in these musings is that we've all gone along with the marketing departments in their quests to make their bosses richer (and, more importantly, keep their jobs). We've emptied our wallets into IBM and Apple Computer for no good reason.
So, next time you flick that switch on your Pentium processor-based, SVGA local-bus video, 17" monitor, 16-megabyte RAM, 540 MB hard disk, CD-ROM-using machine so that you can play the latest videogame, remember that you're paying homage to the great gods of marketing (and your local computer outlet).

One cool thing on my monitor (some Zenith) is a 40/80 column switch on the back. On 40, a Gr.0 screen fills the entire screen horizontally, and in 40, it's a square (as opposed to a rectangle) in the middle of the screen. For some reason though, I use the 80 setting for use in 40 columns because the chars look smaller and sharper, but when I'm in virtual 80 columns (Ice-T) I switch to 40, so the Gr.8 fills the entire screen, and the letters are nice, sharp and readable. (40-column in this mode looks wide and ugly!)

just my quarter-nybble (or whatever)

You brought up some very good points in your post; I would argue that computers spend most of their available cycles waiting for you to press a key. You don't need a high-speed CPU to do word processing or basic spreadsheet work. The same goes for hard drive storage and RAM; it doesn't take 16MB of RAM and 300MB of hard disk drive space to write business letters or do telecommunications work.

However, I would argue that 80 columns is a must for efficient word processing (an 8-bit Atari can, of course, display 80 columns with an XEP80, Omniview, BIT-3, or Austin-80 board).

While programs such as AtariWriter do not offer the functionality of Microsoft Word v6.0, most people who use word processing programs do not utilize 90% of Word's advanced features. What percent of Word users utilize such features as annotations, footnotes, tables, drop caps, graphs, multiple columns, the equation editor, the glossary, or mail merge?

Personally, for word processing and communications, I prefer an older computer with a huge monochrome screen (I presently use a 1989 vintage Mac IIx with a 20" Apple monochrome display).

Actually, I remember an article on PaperClip in Antic sometime around
1986-7 where they compared the features of PaperClip quite favorably
against the current version of WordStar then in vogue in the MSDOS
world. :) And both PaperClip and (if I remember) First XLENT
could do annotations, footnotes and mail merge. Not to mention included
graphics. (Though not WYSIWYG graphics) :)

I did my first two years of college using an 800XL and a Panasonic
KXP1091 (This was 1988-89). When the keyboard on the 800XL began to die,
I bought a 130XE real cheap and kept on working. These were (and are)
quite usable machines. (I also have a Remington portable manual
typewriter, ca. 1920, which is still perfectly usable-- old doesn't mean
bad at all).

Since college, I've worked as a temp secretary at times, using lots and
lots of different machines and word processors. (At last count, I was
comfortable at something around 22 different programs/machines) I have
yet to come across *anybody* who could justify wasting the 40-60 megs
necessary for a full installation of today's "modern" word processors.
Yeah, I own and use MacWordPerfect. But as a page layout program (which
is what a lot of the bulk of the thing is) it's barely usable for serious
work. Word for Windows can do some pretty powerful stuff-- stuff that
99% of users won't and don't need to learn.

If my memory serves me, PaperClip was 212 sectors on a single-density disk.
About 26k. And it did the job quite well. I'm not sure if I could have
written my senior thesis (82 pages, tons of footnotes) on it without
problems, but it served me quite well for years.

btw, on a related note, does anyone have either a list of ATASCII codes
for formatting in PaperClip, or a translator that'll get it into
Word/WordPerfect/RTF format? It'd be nice to be able to access my old
writings, formatting intact, without having to bounce across the house to
boot up the Atari.

Source record: 97280

The computers of today provide no real increased value
to the average consumer over the computers of a decade ago.
Rather, today's computers provide nothing more than marketing
fodder, otherwise known as bells and whistles

Computers such as the Atari 8-bit line, the Apple][']s
and the Commodore 64/128 provide all the computing power
necessary for a vast majority of home users. Such tasks as
word processing, spreadsheet calculation, database searching
and telecommunications are non-intensive tasks which can be
quickly performed by even the earliest 8-bit computers having
a minimal amount of memory. These tasks account for 99% of
all non-game computer use.

In the case of game programs, more powerful machines
produce higher-resolution graphics, so there is a feeling
that the equipment is necessary. However, the same effects
can be achieved by both a $2500.00 computer and a $250.00
dedicated game machine. Clearly, high-quality games are not
a good reason to spend thousands of dollars on computers.

The remaining computer use legitimately requires
powerful computers. Such tasks as graphics processing using
sophisticated paint programs such as Corel, and engineering
programs such as AutoCAD are prime examples of this.
However, home usage of such programs is very small, and does
not account for the widespread usage of powerful computers.

In fact, a disproportionate amount of processing power
today is drawn off by the operating system. This is true of
Windows, OS/2 and Macintosh. The argument is that the
computer is supposed to do work for the users, rather than
the other way around. Thus, rather than typing a file name,
the user simply clicks on an icon.

However well-founded that argument may be, all users of
these operating systems know that, in practice, the ease-of-
use issue is never as simple as the marketing folks tell us
it is. Rather, people end up learning non-intuitive skills
such as icon recognition and mouse control rather than typing
skill, which is transferable and useful outside of the
computer world. In addition, most computer users must know
how to type in any case, in order to use the applications
they are loading. So, in this sense, the user is still
working for the computer by learning these new skills.

Now that it has been shown that it is by no means necessary for the vast majority of computer users to own today's equipment, an alternative will be presented. It is an alternative which has already been mentioned in this article.

The classic 8-bit computers are perfect for today's users. They can be manufactured cheaply, the software for them is abundant, and there are numerous programmers who have cut their teeth on these computers who would be able to produce effective and astonishing programs for them.

In addition, in capping off the growth in home computing power, stability would be achieved which would ensure a large reservoir of resources for computer users. From programs to fellow users and from books to magazines, the user would be presented with a wide range of information that would retain its usefulness in perpetuity.

The other side of this coin is that manufacturers would no longer be able to re-sell product to existing users at such a fast pace. Rather, the market would become like that for toasters, radios and electric razors. Periodic replacement would be the leading reason users would re-purchase equipment.

The focus would instead turn to software innovation, where it belongs. Newer and better programs are always welcome as they offer real increased utility and value for purchasers.

Thus, consumers would win in a world without hardware advances. However, since the manufacturers would not win, it will, of course, never happen unless consumers indicate that is their wish by their purchasing pattern.

Rick Cortese reckons that a 4 joystick hack won't happen. Well, Rick, think again - one's already on the drawing board. However, it won't be a straight hardware hack but just a simple board that hooks up to the standard joystick ports on an XL (or an old 400/800 if you're so inclined).

Thing is I'm having a bit of a debate with one of the club members at the moment as to which is the best way to build it. My method will probably be more expensive but also potentially more reliable (however, it will restrict the maximum number of ports to just 6 on an XL :)), whereas the member's idea will probably be cheaper but possibly less reliable (although it should allow anything up to 256 joysticks to be hooked up **choke**). It's being designed because of my next project which will be a clone of one of the best multi-player arcade games out at the moment.

Whether it will get supported by other software in the future is another thing, but then that's the problem whenever a new add-on appears. No sooner that you think you have set a new standard (256K and all the mod cons) then something else appears that needs supporting. The idea of a new standard is a good one but unlikely.

I'm under the impression the MARS will just dedicate some pins of the programable logic device to bank switching. It's a pretty cute system, all Mike has to do is tranfer a circuit design done with standard TTL logic into a program that automatically compiles the circuit & programs the device. I got the impression that you could just about take the entire schematic from memory expanded xl [Rambo for instance] & combine all the descrete logic, [74ls157, 74ls138, maybe the 6520, ...] onto a single device. The one he showed me was in circuit programable so if you wanted to do stuff like change the memory banking circuit from Rambo compatible to Axalon, all you'd have to do is talk him into sending the circuit through his compiler & downloading the file from a bbs. Your 8 bit would then run the file & convert itself into an Axalon compatible 800.

Dave; I'm glad to hear you're hacking 8 bits as I'm of the opinion that virtually everything done is instuctive, but I think we may have to live with a difference of opinion about standards. I'm assuming that FTE will be successful for at least a couple of years. Since Mike has the rights to all the ICD/OSS/Newell lines as well as being "The only game in town" he will probably set the next standard for OS, memory expansion, hard drives, whatever. I have a low threshold for what I consider a standard so if say 10%-20% of us upgrade to a FTE product, that would be enough to satisfy me. Even if your joystick hack gets up in the morning & makes you coffee I don't think that many people will install it. More of a refllection of the average 8 bitter then the merits of your hack.
Rick

Andrew; I always thought there were two reasons for the printer port:
First is serial data is inverted on a serial port so you'd need a hardware
hack. 2nd if you're using your serial port for Atari-IBM<or ST> communication
you'd have more trouble finding a free serial port for modems. I kind of
like serial ports myself just because they've got all the timing built in.
I'm sure I could hack a single chip solution ala SIO2PC for hooking up a
drive to the serial port, but could you explain why you feel it is necessary
to have one? I mean there seems to be various utilities for converting &
transfering files already, do you just want a little more convinience?

Agreed. I'd say the minimum hardware configuration would be something
like 48K, 80-columns, SS/SD disk drive, 80-column dot matrix printer.
This sort of setup could easily be achieved by Atari, Apple and Commodore
8-bit machines.

Well, since I'm back, here's a good a place as any to jump back into the fray. Here's my view of things.

For years now I've been coaxing and tricking my Atari 8 bit computer to do all sorts of things. Many of these tasks were considered undoable by an Atari in its early years. As my needs progressed, so did the add-ons, hacks, and peripherals that I added to the Atari.
As my demand for sharper printed output increased, I migrated to a 24 pin and then to a Inkjet printer. With the Inkjet, I was able to take turn a Textpro file, 50% of which was control codes, into a nice crisp looking Resume. For text based word processing, using a 24 pin or inkjet printer, and it's standard built in fonts, the 8 bit is quite well suited to the task.

This fall I returned to college, to finish my bachelor's degree in Electrical & Electronic Engineering Technology. I suddenly found the 8 bit unable to meet my needs. Technical reports require something above and beyond standard ASCII text that's well laid out and looks nice. Technical reports often include mathematical formulas and equations, tables of theoretical and measured experimental data, and technical diagrams inserted into the text and referenced.
These things the Atari was unable to do. No matter what you do to a B/Graph graph, it still 320x200 resolution. There exist no applications for creating electrical, chemical, or mechanical drawings or figures on the Atari. Once I had a rough draft of my report written down with a pen, it took me two days to come up with a report that was minimally acceptable. This report did not include technical drawings, just a few mathematical formulas and one table. I used Daisy Dot III to produce the document. Producing a character set (or two) used to produce the horizontal and vertical monospaced lines in a table, and then using it was a huge pain. I also had to create my own set of Greek symbols for use in equations, and it required numerous sample prints to get the equations and the data table properly aligned, so that everything was where it was supposed to be.
The next day, finding some missed typos, I went and re-entered the same report into Wordperfect 5.1 for DOS. It took me 2 hours, and at the time I was minimally familiar with Word Perfect. Since then I've learned how to create any sort of drawing I wish in a shareware CAD program, and import it directly into Word Perfect. Creating tables are a breeze once you get accustomed to it. Best of all, with Word Perfect's spell checker and thesaurus, and external shareware grammar and style checkers, my reports are better laid out now than they've ever been before.

I have no problem admitting that cutesy little home tasks like a Christmas card mailing list, or a database of recipes or a musical CD collection

can be easily dealt with on the Atari. However, as a society which continues to become more and more technically oriented, I've begun to find the Atari 8 bit severely lacking in more sophisticated applications. Yes, there are others out there like me, such as Ben Poehland, with whom I tried in vain to write my own technical drawing program for the Atari.

The things which the atari does, and has done for years, it does quite well. I disagree however, with those who say there's little reason to purchase something other than their 8 bit.
I own a PC clone now. It didn't cost me $2000, it cost me $600.00. It's a 386DX40 and it runs Wordperfect very well. My wife uses it and Microsoft Works for DOS for her school homework.

I'm proud of how far the Atari has carried me. Though it gets less use now than it did before, by no means will I be putting it in a closet, or selling it at a garage sale anytime soon. On the contrary, I'm loaning one of my systems to my Dad back home so that he and I can keep in touch via e-mail. There just comes a time when a person finds tasks which the Atari simply can't do any longer.

Jeff

As a potential buyer of this program (having owned an Atari 400 as my first
computer, way, way back in history) I have to second this. So many important
features are missing; sound, player missile collision, etc.

Take Brians advice, he, and I, know what we are talking about.

Essentially, yes. Most of the programs out there for converting
atari<>ibm are buggy... (Yes, they work! And in fact I almost always use
them) but they also need to be in double density...etc...

I was thinking along the lines of how WONDERFUL it would be to:

"Darn...that copy of such and such is on the IBM... "
(plug 1050 [any chip model, even STOCK 1050's] into the good ol' PC crap)
"Okay.. um... (slips a blank disk in the drive) format dos3 mode. "
(dos 3 is used as an example only!!! its to show that ANY format
can be used.)
"now... (from dos) copy cool8bit.fil x:\cool8bit.fil"
"now... (from unix) cp cool8bit.fil x:\cool8bit.fil"

hehe..just thought of something odd... hehe Mounting a 1050 under unix.
ahahahah

and reading files from the 1050 would just be as easy...
think of booting up games using a real 1050 for the XF emulator.
or what if you don't have a 1050 but a friend does and you want to play
his such and such on your XF..just plug his drive in and copy the disk.

I like this idea toooo much... I think I will work on it...

so.. is it to be serial or parrallel? A par. device is going to have to
use bit converts/drivers and is a bitch to make work under unix...
especially when the device drivers for the PRINTER PORT (what it really is)
are not bi-directional usually. This requires new device drivers and
rebuilding the kernel.

about the inverted serial data... what do you mean exactly?
atari's sio send/receive data lines use bits backwards?

Here's a good example of something that is not an application that the Atari does well. Certainly, there are such things. [Read my "A Call To Arms" post for a more thorough look at this whole issue.] But, I hardly think that a significant portion of the population needs to do such things at home. My argument is that the vast majority of users do not benefit to any significant degree from the expensive computers they are buying. I believe your specific example does not disprove this theory.

It's time for us to get off the technology treadmill.

I believe the way to accomplish this is to do what has been suggested since the early days of mass-market computers: figure out what you need to do, then find the computer that can do it.
Don't just go out and buy the latest and greatest. Don't believe the marketing hype that tells us we've "just gotta" have the latest software [which contains a myriad of features you'll never use], and the latest equipment to run it on [because it uses bloated code and is run on an inefficient graphical operating system such as Windows 3.0].

As I've said, most people have a computer that has far more power than they need. It's just silly to buy into the marketing hype.

-Joe

>I own a PC clone now. It didn't cost me $2000, it cost me $600.00.
>It's a 386DX40 and it runs Wordperfect very well. My wife uses it and
>Microsoft Works for DOS for her school homework.

I, too, own a low-cost system. I own a 286 that has been running for years, I own a 386DX-40 that cost me very little to build, and a direct-market 486DX2-50 that cost me a bundle. I'm as guilty as the next person. :)

Here, you're proving my point: that $600 computer is doing the job for you just fine, and will continue to do so. Even though there may never be another Wordperfect version that executes in DOS, even though the latest and greatest may not run quickly on your computer, the stuff you have now will continue to work. Obselescence does not mean the equipment and/or software become useless.
You've done the sensible thing in your situation. You had a specifric [er, specific] task that could not be accomplished on your present system (the Atari), so you went out and found a low-cost alternative.
On the other hand, most folks become convinced that if they don't buy

the top-of-the-line (or very near to it) right now, they'll HAVE to upgrade sooner. So, they spend those thousands of dollars and get a machine that has more power than they need.

>The things which the atari does, and has done for years, it does quite well.

Absolutely. And what it does is what most people need: word processing, spreadsheets, data bases and telecommunications.

-Joe
PS: When I wrote that original note, I did it in "ha ha only serious" mode. However, on reflection, I felt it needed a more serious treatment. That is why the message under the heading "a call to arms" was created. Read it for another look at the issue.

> fodder, otherwise known as bells and whistles

Disagreed. Computers of today can do everything that computers
of a decade ago did. Computers of today do those things both EASIER and
FASTER. Computers of today do a lot of things the old ones couldn't -
like desktop publishing, multimedia/CD-ROM. PCs of today are also more
reliable. How many BBS sysops remember the days of running boards on
floppies? I used to do it. It wasn't reliable. I'm not saying hard
drives never crash, but modern hard drives are more reliable than
floppies, and more reliable than the old hard drives of 10 years ago
(auto-parking heads, for example). An example of a "bell or whistle"
might be the curvature of the bezel of a monitor or of a computer case or
a digital "MHz" display.

>
> Computers such as the Atari 8-bit line, the Apple]['s
> and the Commodore 64/128 provide all the computing power
> necessary for a vast majority of home users.

The Commodores had such slow disk access (about 2400 baud, I
believe) that it was possible to rig the Commodore cassette drive to load
faster than the 1541 disk drive. The Atari 8-bit's drives were always
quite slow as well. The Apple II was the only one of the 3 to offer a
workable 80-col screen and parallel-interface drives. Too bad the
graphics and sound sucked. All the computing power necessary for a home
user? No....I like to log on to a BBS and capture the entire message
base (at 14.4K BPS) into buffer. It takes a bit more then 64K. So does
maintaining all the fonts in word processing, as well as writing a
75-page report.

It can be done easier with a modern computer, though, and a
better job done at that. Word processors are easier to use and simply do
more. Atariwriter just didn't have that online thesaurus or check
spelling in a matter of seconds like Wordperfect does for me...and I am

behind the times with ver. 5 for DOS!

>

Why $2500 and $250? Why not $1200 (DX2/66 8MB/420MB 15" monitor,
etc). Most of my Super-NES owning friends think a PC is worth $1200 when
they see the games...and all the non-game applications.

So what's your hurry if the OS zaps a little performance? If
those old 8-bit machines pacified you, a clock-doubled modern PC with a
dragging OS should be a rocket to you.

> However well-founded that argument may be, all users of

Good heavens. The user simply clicks on the pop-down menu and
selects what he SEES instead of remembering a bunch of
CONTROL-ALTERNAL-FKEY combinations. If "icon recognition" and "mouse
control" is challenging, then bladder control must be also.

>

I suppose we could all drive VW Beetles, too. It would get us to
where we want to go. I think I'll take a more modern approach at
transportation. Does not the same apply for computers?

6499. Peachtree accounting system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-22 02:47:37 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Nov21.214647.11552@wariat.UUCP>
Source record: 97079

Peachtree Back to Basics Accounting System:
General Ledger
Accounts Receivable
Accounts Payable

This is a six disk set, two disks with each 'module'.
Included is an unrunable backup of the disks for restoration
purposes if the protected originals ever get corrupted.
Peachtree is still in business, so you should be able to get
product support if you encounter any problems. The
registration cards are included (never registered.) I will
include a receipt for two of the modules (can't find the
other receipt.) There is a book with each 'module'. The
three books are identical except for one says 'General
Ledger', one says 'Accounts Receivable' and one says
'Accounts Payable'. The documentation looks to be
outstanding. Six chapters, including a first chapter on the
basics of accounting principles. There is a glossary and an
index.
These disks and books have never been used other than to
open the shrink wrap and boot the disks just to see that
they worked. I thought I might wish to learn accounting and
maybe do it on the side. This accounting system needs two
single density disk drives, Atari 8-bit and a printer
(probably an Epson compatible).
If anyone ever saw these 'modules' in a store, they know
that I paid well over $120 for all three.
I am selling 'AS IS', so if you want me to make sure the
disks still boot, you'll have to specify that to me.

Price: $60 shipped COD to buyer in the U.S.

6500. MULE on PC Xformer

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-22 03:42:03 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2ED0C5A8@POST0.LAAFB.AF.MIL>
Source record: 97085

I heard an interesting thing this weekend on FidoNet, I think. Someone purported that there were two different versions of MULE (the Electronic Arts game). The first was written for the Atari 800. The second for the XL/XE. There has been mixed success in running the game on the other machine.

I have never run MULE (the game) on the XL/XE. I use my 800 on our 32" TV. The box says all you have to do is Hold Option on the XL to get it to run.

Has anyone else heard about this? Maybe this is why people are having problems running MULE with PC Xformer. I think the real reason people are having problems is that MULE is a commercial, copy protected game. I'm not sure if PCs support four joysticks. Does anyone know about that.

Perhaps people are talking about MULE, the 8-bit/PC utility program.

Rick Reaser

>purported that there were two different versions of MULE (the Electronic
>Arts game). The first was written for the Atari 800. The second for the
>XL/XE. There has been mixed success in running the game on the other
>machine.

They may have revised MULE to run on the XL/XEs. Some EA games looked
for an Omnimon, by checking for ROM at $C000. The Omnimon was used by
hackers to disassemble protected games among other things. Trouble is
the XLs 'looked' the same and the game locked.

I've had limited success with XL/XE only titles. "The Eidolon" won't
work, for instance.

>I have never run MULE (the game) on the XL/XE. I use my 800 on our 32" TV.
> The box says all you have to do is Hold Option on the XL to get it to run.

Option keeps BASIC from loading. PC X-former lets you turn BASIC on and off
with Shift-F10.

6503. Atari stuff for Sale!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-22 06:49:41 UTC
From: bensmith@teleport.com
Message-ID: <3as4a5$6t2@linda.teleport.com>
Source record: 97158

Following is some Atari stuff I Have
for Sale.

Following is my Classic Atari 8-Bit
HardWare Catalog:

PS=Power Supply.

Atari 130xe, 128K
w/PS & Manual.....$75 U.S.

Atari 800xl, 64k
w/PS.....$50 U.S.

Atari 800xl, 64k
w/o PS.....$40 U.S.

Atari 800, 48K/52K/Impossible Chip
40/80 Column, w/o PS.....$50 U.S.

Atari 800, 256K Happy Compatible
Ram Disk * Makes One Pass copies
with Happy Drive, OmniMon/800 OS/?
Cold Reset Button,Pill Chip
w/PS.....$80 U.S.

Atari 800, 48K
w/o PS.....$20 U.S.

Atari xf551 Disk Drive, DS/DD, New
w/Box, Manual, Dos, PS.....$175 U.S.

Atari xf551 Disk Drive, DS/DD, New
Drive Only, w/o PS.....$125 U.S.

Atari 1050 Disk Drive, SS/ED, w/PS,
DOS, Manual & SIO Cable.....$70 U.S.

Atari 1050 Disk Drive, SS/ED, w/PS,
DOS, & SIO Cable.....$60 U.S.

Atari 1050 Disk Drive, SS/ED
w/o PS.....$50 U.S.

Atari 810 Disk Drive, SS/SD
w/PS.....$30 U.S.

Atari 1020 Plotter (Color Printer)
Direct Connect, w/o PS.....$25 U.S.

Atari 850 Interface
Lets your Atari use standard modems
and Printers, w/o PS........$50 U.S.

ATR8000 by SWP (For CPM etc.)
PS Built in, CPU only.......$50 U.S.

MPP-1100 Printer InterFace
No PS Needed, Plugs into Joystick
Port, as is.................$10 U.S.

Atari CX85 Numeric KeyPad
Plugs into Jostick Port.....$8 U.S.

Atari XM301 modem, 300bps
Direct Connect, needs no PS..$8 U.S.

Atari 1010 Program Recorder
Cassette Storage, w/PS.......$8 U.S.

Atari 410 Program Recorder
Uses standard cassette tapes
w/Built In PS................$5 U.S.

JoySticks, Many makes/models
E-Mail or Call Voice for more info.
Starting at only ....$5 U.S.

Following is my Classic Atari 8-Bit
SoftWare Catalog:

An Invitation to Programming 1:
Atari, Cassette, Box...........$5.00

An Invitation to Programming 3:
Atari, Cassette, Box, & Docs...$5.00

Archon, Electronic Arts, Disk..$5.00

Asteroids, Atari, Cart.........$5.00

AtariLab light module
Atari, Cart, Box, & Docs......$10.00

Atari Basic Cartridge..........$5.00

Basic A+ (with OS/A+)
OSS, Disk, & Docs.............$10.00

Atari Basketball Cart..........$5.00

Battle of Antietam
SSI, Disk, Box, & Docs........$20.00

Blue Max Cart, Atari...........$5.00

Carrier Force
SSI, Disk, Box, & Docs.....$20.00

Centipede Cart, Atari.....$5.00

Clear for Action, Avalon Hill
Disk, Box, & Docs.....$20.00

Colonial Conquest
SSI, Disk, Box, & Docs.....$20.00

Computer Ambush
SSI, Disk, Box, & Docs.....$20.00

Computer Quarterback
SSI, Disk, Box, & Docs.....$10.00

Cutthroats, Infocom
Disk, Box, Maps, & Docs.....$20.00

David's Midnight Magic
Broderbund, Disk, Box, & Docs.$10.00

Deadline, Infocom, Disk.....$5.00

Deadline, Infocom
Disk, Box, Maps, & Docs.....$20.00

Defender Cart, Atari.....$5.00

Desk Top Video April 88
Antic, Disk.....$5.00

Dog Daze
APX, Cassette, Box, & Docs.....$5.00

Donkey Kong Cart, Atari.....$5.00

Encounter, Synapse, Disk.....$5.00

Fight Night Cart, Atari.....$5.00

Financial Asset Management System
APX, Disk, Box, & Docs.....$10.00

Flight Simulator II, Sublogic
Disk, Box, Maps, & Docs.....$20.00

Forbidden Forest, Cosmi
Atari/C64, Disk, Box, & Docs..$10.00

FujiBoink Disk, Atari???.....$5.00

Gettysburg - The Turning Point
SSI, Disk, Box, & Docs.....$20.00

Gorf, Roklan
Cart, Box, & Docs.....$5.00

Hacker, Activision, Disk & Box.$5.00

Humpty Dumpty & Jack and Jill
Thorne EMI Video
Cassette, Box, & Docs.....$5.00

Infidel Disk, Infocom.....$5.00

Juggles' House, Atari
Cassette, Box, & Docs.....$5.00

Kampfgruppe, SSI
Disk, Box, & Docs.....$20.00

Kennedy Approach, Microprose
Disk & Docs.....$10.00

Knights of the Desert
SSI Apple/Atari Disk/ TRS-80 Cass
Disk, Cassette, Box, & Docs...$20.00

Legionnaire, Avalon Hill
Disk, Cassette, Box, & Docs...$20.00

Lords of Conquest
Electronic Arts
Disk, Box, & Docs.....$10.00

Marauder, Sierra On Line, Disk.$5.00

Match Racer, Gebelli
Disk & Reference.....$5.00

Math Blaster!
Davidson Atari/Commodore 64/128
Disk, Box, & Docs.....$5.00

Mech Brigade, SSI
Disk, Box, & Docs.....$20.00

Well, There is in fact a way of doing this at home on your XL/XE,
by learning Postscript!!!!!!
You could produce a postscript file in f.ex. Textpro just aswell as Word
could do it.
I have a friend who learned postscript and he say's its pretty cool..
In this manner you could produce any complicated formulae..

Rick Cortese said:
> Dave; I'm glad to hear you're hacking 8 bits as I'm of the opinion that
> virtually everything done is instuctive, but I think we may have to
> live with a difference of opinion about standards.

Not neccessarily. I for one am all for a new standard. I don't know what the software situation is over in the States but from what I've seen, it's pretty lacklustre with commercial software even being written in Basic. The Tyne and Wear Atari User Group received a piece of software a while ago from the States to evaluate for publication in the UK. It was crap shoot-em 'up written in Atari Basic and I've since seen it listed in the vendors/developer's list. Whether or not this is indictive of the State of US developers these days, I don't know.

Over here we have a mass of German, Dutch and Polish imports available and all of very high quality. The only problem is a complete lack of originality. Part of the problem, I'm sure, is the fact that all the European games software I know about run on 64K Ataris. We have been flooded with top quality puzzle games and shoot 'em ups but little else because you can't fit much onto a 64K machine. In fact, there's absolutely sod all worth buying unless you like shoot 'em ups and puzzle games (there's about half a dozen Tetris clones available).

If a new RAM standard of about 256 could be agreed between the developers, then that would be a good place to start. Mind you, the Germans will probably still end up producing 256K versions of Tetris!!

> I'm assuming that FTE

> of the average 8 bitter then the merits of your hack.
> Rick
>

Really, in order to set a new standard you have to be looking closer to the 50% mark. RAM upgrades are actually pretty close to that. In the club's membership, for example, 90% of users have at least 128K and 70% have at least 256K - with something like 25% of the total membership having 1Mb machines.

Other bits and pieces are going to be a long time in reaching this level. In the UK, hard drive users are almost non-existent. Also the Turbo816 upgrade was available over here for a short time but obviously didn't do very well - probably because the device wasn't fully compatible with the 6502.

A fairly high threshold is a must before developers will really look to move the Atari 8-bit on a bit. After all if a 256K standard is adopted it will mean longer production times and reduce the potential user base for their software. Personally, I don't see anything wrong with setting a 256K RAM standard since RAM upgrades aren't too expensive in the first place.

I think that it is about time that developers took the lead on this. Up till now we've been led by the user. It's the same old thing, though, isn't it? A device comes out but no-one buys it because there's no support and there's no support because no-one buys it - and then if people do buy it they moan due to a lack of support, or if you go the other way then the rest of the user base moan because you're producing software that will only run on souped-up machines.

I think that developers who jump ahead of the others with regards to setting a new standard can take some heart out of the situation on the PC - people began writing software for CD ROM before they started to become popular ... now look at it go!!

#> So, has this been done or am I being drafted? =)

I found a program on the archive which written for this job, but
when I tried it didn't worked, sometimes the LED lit, and the
program reads something, but i wasn't very serious...
But you can try it if you want...
Get this file:
Misc/atariem2.zip or Misc/at800xl.zip
I don't know which have it but the program's name is SIOCOPY (I
think...)

Good luck!

Fredrik,

I actually looked into this. I was considering buying the Epson ActionLaser
1100 printer, 4 meg upgrade, and postscript option, and then also buying
all the books that I would need to learn post script. Why bother?
It would have cost me more to do this than to purchase the PC I'm using now.
And how, pray tell, would I have constructed charts, graphs, and
technical drawings for inclusion in a postscript program?

Jeff

If you're loading sectors directly from the disk then its the SIO you want,
not the CIO. The CIO accesses the disk at filename level, the SIO reads the
sectors directly. Here's how you do it:
set DDEVIC (768) to 49 (49= disk drive)
set DUNIT (769) to the number of the drive, 1 for drive 1, 2 for drive 2, etc.
set DCOMND (770) to 82 for read sector
set DSTATS (771) to 64 to receive data from drive (128 = send data)
set DBUFLO and DBUFHI (772,773) to the low byte, high byte of your buffer into
which you're going to read the sector.
set DBYTLO and DBYTHI (776,777) to the size of the sector (128,0) for
single/enhanced density or (0,1) for double density.
set DAUX1 and DAUX2 (778, 779) to the sector number you want to read. Note:
sector numbers start at 1 not 0!
then finaly you do a JSR $E459
that should do you fine!
(all numbers above are in decimal.. except the JSR address)

ATARI LYNX (color hand held game console) for sale:

My son wishes to sell his Atari Lynx complete with 4 or 5 game cards,
com-link cable, car cigarette lighter power adapter, etc. It's in
good condition and works just fine.

We are only looking at about $50 plus shipping so it's a good deal.
Would make a great Christmas present for kids (or yourself).

Sorry that I don't have the game titles with me right now but I'll
round those up tomorrow for anyone interested via email.

Sorry for the crossposts but I wasn't sure where to put this.

Just having expanded ram is not enough. You also have to know quite a bit about it if you want to use more then the XE banks. For instance, setting the same bits on a Rambo as a Newell will make the 1st 16k of RAM appear in the window. Write something to it & blamo. The only person I think that ever really understood RAM banking schemes completely was Tim Patrick. I confess to being frustrated by my SDX, I though USENONE in my config.sys file would free all 12 banks, not so. A MEM cmd said I only had 11 banks available & sure enough when I tried to use the 12 bank all my DOS functions disappeard. The reason I used SDX is my OMINMON OS doesn't co-exist with disk based SD. Now that Rambo, Newell, OMINMON, SDX, etcetera are all under the FTE umbrella I think we may be able to see better compatability in at least the next generation products.
Odd, but my favorite game & the one I always come back to is the "Pools of Radiance" series. Last time I played was just last night wandering around in the Silver Blades installment on my clone. The funny thing is these also came out for the C64. I wish the market would have been there for the 8 bit when these came out. The Atari could have come off favorably when compared to CGA graphics & would have won hands down on sound.
Every once in awhile I toy with the idea of writing a simple 3-D Rogue type game for the 8 bit, but then I come back to reality & realize I'd never have the energy to do a decent job of it.

Computer Gaming Survey

Could you please take time to answer our questions about computer games, for a survey we are conducting. Thank you.

NB Questions can be answered by either the following format:-

1a, 2e, 3a, ... and so on until completion of question 12.

Or

Edit it by just marking a *** next to the correct answer for you ie:-

1) Are you?
a) ***Male b) Female

Details of where to send your answers are given at the end of this file.

AND THERE'S MORE ...

****
****
****
****** ****** ********** ********** **********
**** **** *** ** * *** *** ** ** ******* *
*** *** *** ** ** ** *** ** *** ***** **

********* ** *** ** *** ****** **** ********** ******
********* ** *** ** **** ****** ***** ******* ******
*** **** *** **** ****** ****** ******* ******
*** **********
****
****
****

1) Are you?

a) Male b) Female

2) How old are you?

a) under 12 b) 12 - 14
c) 15 - 17 d) 18 - 20

e) 21 - 23 f) 24 - 29
g) 30 - 39 h) 40 - 49
i) Over 50

3) Do you have a computer?

a) Yes b) No

4) If yes then is it a?

a) An IBM compatible PC b) MAC
c) Amiga/ST d) Console
e) Some other (i.e. 8 bit like com 64)

5) How long have you had your machine?

a) Less than 6 months b) 6 months to 1 year
c) Between 1 & 2 years d) Between 2 & 4 years
e) Between 4 & 6 years e) Over 6 years

6) How long have you been using computers?

a) Less than 6 months b) 6 months to 1 year
b) Between 1 & 2 years d) Between 2 & 4 years
e) Between 4 & 6 years f) Between 6 & 10 years
g) Over 10 years

7) If you had another computer previously then was it a?

a) An IBM compatible PC b) MAC
c) Amiga/ST d) Console
e) Some other (i.e. 8 bit like com 64)

8) What types of software do you spend alot of money on?

a) Business b) Applications
c) Games d) Other

9) Do you like computer games?

a) Yes b) No

10) What type of game do you most like to play?

a) Role-playing b) Puzzle
c) Adventure d) Beat-em-up
e) Simulations f) Platform
g) Strategy h) Shoot-em-up
i) Car Racing j) Sports
k) Other

11) How much do you spend on games per year in pounds (dollars)?

a) Up to £30 ($40)
b) £30 ($45) - £60 ($90)
c) £60 ($90) - £90 ($135)

d) £90 ($135) - £120 ($180)
e) £120 ($180) - £160 ($225)
f) £160 ($225) - £200 ($300)
g) £200 ($300) - £400 ($600)
h) Over £400 ($600)

12) Approximately how many games do you purchase per year?

a) 0 - 2 b) 3 - 5 c) 6 - 9
d) 10 - 14 e) 15 - 25 f) Over 25

Could you please forward your answers to one of the following addresses:-

Cecil@mdx.ac.uk or

Antoni1@mdx.ac.uk or

Colin7@mdx.ac.uk or

Myself:-
Lena3@mdx.ac.uk

THANK YOU FOR YOUR TIME AND HELP IN ANSWERING THE QUESTIONS IN THIS SURVEY FOR OUR PROJECT.

6515. Re: PC21050?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-22 18:01:48 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <127923@cup.portal.com>
Source record: 97174

By inverted data I mean the Atari serial line sends a start bit, the line goes from a 0 to a +5<or there abouts> volts. When an RS232 compatible port sends a start bit it goes from about +9V to -9V. Now that I think about it, you're may be right about the IBM printer port. I don't know that much about them, but I think they can't be switched to I/O vs out only/in only which means some hardware anyway. Another not so small problem is getting Derek to support it. Once you invert the serial data everything is just straight 19,200 baud data. The IBM bios only supports up to 9,600 baud, but I have a .OBJ module for my C compiler that goes 100K+.
$.02 I bought the ST Xformer Cable for about $34 years ago. It's so covered with dust now that I doubt if it well even work anymore. There was also someone who wrote a small progam for the ST that uses the Xformer cable with a 1050 just like it's an ST disk, but of course in a format that's incompatible with everything else. The idea in general has merit, but when it was done on the ST platform it never really took off. If I clear some of my projects out in the next few days I may take a look at it.
Rick

6516. OMNIMON in RAM?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-22 19:23:41 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Nov22.142309.27008@wariat.UUCP>
Source record: 97177

Rick Cortese said his OMNIMON conflicted with disk based
SpartaDOS. And somebody else said MULE (the game) checked to
see if OMNIMON was present and that the xl/xe look to MULE
like a OMNIMON.
Either Rick didn't try SpartaDOS or he really does have a
RAM based OMNIMON. Because OMNIMON is part of the OS ROM,
SpartaDOS uses the RAM under OS ROM. I don't understand why
xl/xe look like OMNIMON on a 800? There is no RAM under the
ROM on an 800, so what exactly was it that MULE checked for?
I know my OMNIMON OS runs SpartaDOS 3.2d. I believe OSNXL
doesn't have the PBI support and international character set
and whatever else Atari put in the $C000-$CFFF area in the
xl/xe. But rather OSNXL has most or all of the monitor
there.

I DL'd Kedit from UMich a while ago (along with KASM, KLINK, etc.) and I have to say I LIKE it! Finally, a disk-based Action!-Editor style editor!!!!!!!!!! Also, it comes with a very fast (comparable to Itay's 80 column driver) set of 40- and 80-column E:-handlers!!!!

Anyways.. I'd like others' thoughts on its reliability (I only got to look at it a little) as well as what you folks think of the other K-programs uploaded lately...

In article <xEy3EN5.ransom22@delphi.com> Joe Walsh <ransom22@delphi.com> writes:

> The truth is, most people would be able to get their
>work done with an unmodified Atari 130XE, a good-quality
>color monitor, an 850 interface, a couple of disk drives, and
>any of the currently produced high-quality/low-cost printers
>and modems. But, would they be happy?

No, because they really couldn't get all of their work done in
a way which satisfies them. With an Atari 8-bit, can you ...
- ... put together multi-page documents with pictures,
multiple fonts, etc, and print them out on a laser printer
at 600dpi and up?
- ... display high-resolution, high-color graphics?
(by high-color, I mean 256+)
- ... access the huge amount of data available on cheap CD-ROMs?
- ... support a 38.4k modem connection, doing VT100 emulation,
at a text res of 132x40?
- ... process and print Postscript files on a non-Postscript printer?
- ... easily add new hardware like video cards, sound cards, even
faster CPUs, and have them be supported seamlessly by most software?
- ... play the newest games AND the old classics?

These are the reasons I have spent a good deal of time and money on my PC.
If I could do all of this on my 8-bits, I would--they're cheaper and
take up much less room (well, maybe...). As it is, however, my 8-bits
tend to just play classic games.

> So, next time you flick that switch on your Pentium
>processor-based, SVGA local-bus video, 17" monitor, 16-
>megabyte RAM, 540 MB hard disk, CD-ROM-using machine so that
>you can play the latest videogame, remember that you're
>paying homage to the great gods of marketing (and your local
>computer outlet).

Nope, you're harnessing the power of a machine that users
5 years ago drooled over, even before the great gods of marketing
found a market for it.

The "general public" seems to want a computer that acts as an
appliance. Such a computer needs multimedia features to
be intuitive and provide a natural user interface (since when is
"Press F to format a disk" natural???), and that requires power (not to
mention support, but notice this is the only time I've
brought *THAT* up).

One of the systems you described above can handle it, and one cannot. I'll let you decide which is which!

Source record: 97010

- ... put together multi-page documents with pictures,
multiple fonts, etc, and print them out on a laser printer
at 600dpi and up?

This isn't possible. What is possible however is Daisy Dot III..
Graphics is harder, fonts aren't as easy to use (to have more than
one size of a font, you have to DRAW them (unless you can settle
with double/triple/etc. width/height)
Connecting a good printer w/ postscript fonts is possible too.
I haven't time to go into more details though.....

- ... display high-resolution, high-color graphics?
(by high-color, I mean 256+)
We have LOW resolution 4096 color graphics, which is damned
nice IMO.. sure, it isn't 320x200x256 or 640x480x256 or 640x480x16m
but it's nice for the 8bit.. many people though have actually gone on
to other systems (Amiga, IBM) for the graphics (GIF/JPG/etc)
viewing alone...

- ... access the huge amount of data available on cheap CD-ROMs?
Via SIO2PC we can read any files an IBM can.. the interface needs
work though (rather than type "I" drive #, filename on the PC, I
think some extra handler should be written for the Atari for
doing this via SIO2PC automatically! :))

- ... support a 38.4k modem connection, doing VT100 emulation,
at a text res of 132x40?

14.4k at 80x24 ... more isn't often needed I think.. not in text

- ... process and print Postscript files on a non-Postscript printer?

Uhhhh..

- ... easily add new hardware like video cards, sound cards, even
faster CPUs, and have them be supported seamlessly by most software?

Not really.. OS upgrades, yes... MARS8, yes...

- ... play the newest games AND the old classics?

New games are still comign out if you wanne be techincal :)

>Not really.. OS upgrades, yes... MARS8, yes...

I'd go further and say, is it really necessary? (Kind of like the WWII billboards that said, "Was this trip really necessary?" <G>)
If you're happy with the system you have, do you need such upgradability? Really, this particular point isn't a valid argument, as what we're arguing about is whether it is worthwhile to have one of the new, expensive computers with their features....saying that they can be made faster isn't really an argument for spending all that money, to me. :)

Ah, well, at least it appears there are a few folks out there who, at the very least, feel that consumers are not making a wise choice in jumping on the bandwagon with the companies who insist everyone absolutely must have the latest and fastest computer, or they're wasting their time....

-Joe

Date: Tue, 22 Nov 94 13:43:22 PST
From: jharris@cup.portal.com
To: krishna@max.tiac.net
Subject: Can you Deliver?

Hi Glenn,

I wanted to post in the recent "A Call to arms" discussion, and my service has temporarily lost outgoing net access. Could you post this for me?

.....

Some major points are being missed here.

The kind of people that bought computers in the early '80s were very technically oriented. Most of the computer owners today are the kind of people that have trouble programming their VCR. Seriously! How many different schemes have come out to make VCR programming easier?!? For these people, icons and menus and WYSIWYG are essential. Because if they can't see it and point at it, they won't be able to figure it out.

Next, time is an important commodity. Something that saves people time is worth money. I can get stuff done using modern word processors much easier and faster than with the Atari8. Not to mention better results, so I am willing to pay for that.

We can't force today's programmers to program as efficiently as they used to. As long as faster machines exist to run their sloppy code, they'll continue to write sloppier code. I may not like it, but if a new application or game comes along that I want to use, I'd rather have a machine fast enough to run it the way it was intended, versus having my productivity slowed down, or even doing without it.

>...Atari 8 bit best for games...

Sorry. The _only_ reason I wanted an IBM compatible over the last several years was to play games. The quality and depth of available games is unmatched by any dedicated game system. New systems like Jaguar and 3DO may provide the quality, but depth is likely to still lag far behind. Personally, I already had an Amiga 3000 as my primary productivity computer, so I was unwilling to spend another $2000 on a IBM system just to play games. (It takes at least a 486 and local bus video for today's games). But I still consider it a clear winner as a game system.

All this being said, I come from a unique point of view on the other side of the equation. I _still_ market video character generator systems based on Atari8 technology. I constantly have to defend the choice against other professionals, who see the machine as being inferior to the Amiga (or IBM) for video applications.

First, the Atari8 is the least expensive machine that directly supports NTSC video. When I made my decision to write the software, the price differential was quite large -- especially since the Amiga 600 and 1200 were not available yet.

Second, character generator screens are mostly viewed on RF TV sets from 8 or more feet away, after the signal has traveled down miles of cable and distribution amplifiers. This inevitable form of anti-aliasing helps narrow the gap between Atari8 and current display technology. Plus, the screens are only displayed for a short period of time, and rarely studied for video quality.

Third, the purpose is to convey information. Once that goal has been achieved efficiently, there is very little need to go any further.

This last point is in line with the reasoning given behind the Atari8's viability as a general purpose computing solution, but I don't believe it applies there, for the reasons given earlier. I truly enjoy today's advanced programs. People who are less computer literate require them. I can't deny that there is a lot of waste in today's computing power. But there are a lot of wonderful uses for that power as well, and those uses wouldn't exist if the machines hadn't sold so well in the first place. I can't deny that many of the advances could have been done on the Atari8, (and theoretically still could be), but the hard truth is that there wasn't ever enough motivation, and there certainly is even less now.

I won't give up my Atari8 system anytime in the forseeable future. I'm happy certain projects are underway to make 8 bit life even better. I think it's best to keep certain things in perspective, and realize the Atari8 is a special machine for a unique group of people, but not for the computing world at large. Efforts need to be focused towards acheiving the goals of the remaining users, which are different from those of a general purpose community which does not, and will not, exist.

>(auto-parking heads, for example). An example of a "bell or whistle"
>might be the curvature of the bezel of a monitor or of a computer case or
>a digital "MHz" display.

First off, let me say I enjoyed your note. I was laughing out
loud while reading portions of it. Not at the your counter-argument's
points, of course, but at the phrasing. Which is to say, no, I don't
take this seriously. Not in the sense that a person might take, say
an abortion debate seriously. However I do feel the points I raise
have validity...as does the other side of the argument. It's a nice
thing to explore, is it not?
Anyway . . .

>user? No....I like to log on to a BBS and capture the entire message
>base (at 14.4K BPS) into buffer. It takes a bit more then 64K. So does

>75-page report.

>more. Atariwriter just didn't have that online thesaurus or check
>spelling in a matter of seconds like Wordperfect does for me...and I am
>behind the times with ver. 5 for DOS!

These are some of the numerous specific examples you give troughout your
message. Let me first say that, in many cases, these things can be
done differently with the 8-bit computers, for the most part. For
instance, if you want to log on and grab all the messages to read off-line
(I"ve been running a BBS for years, and no one has done this, to my
knowledge, on my own board..but, okay, for the sake of argument), just
write 'em to disk. With a 360K floppy formatted under SpartaDOS X,
you should have enough room for the messages, unless you like to wait
a long period of time between logons. And, speaking of 64K, the DOS
version of Procomm Plus only offers 64K of scrollback buffer....so
you'd have to log it to disk anyway. :)

> So what's your hurry if the OS zaps a little performance? If
>those old 8-bit machines pacified you, a clock-doubled modern PC with a
>dragging OS should be a rocket to you.

Ah, but are you getting what you paid for? If the OS is dragging system
performance down, I argue that you are not.

I wont' even get into the ubiquitous "Unrecoverable Application
Errors...

> Good heavens. The user simply clicks on the pop-down menu and
>selects what he SEES instead of remembering a bunch of
>CONTROL-ALTERNAL-FKEY combinations. If "icon recognition" and "mouse
>control" is challenging, then bladder control must be also.

This is hilarous, by the way.
Anyway, while icon recognition and mouse control may seem very
intuitive to you and I, it is in reality anything but. I had the unique
priveledge(?) of starting at a company right when they were switching
from the IBM Displaywriter to a LAN-based system running Windows 3.0.
Those poor people were absolutely confused. Their mouse movements made
them seem in the middle of a spastic fit! And, finding the right icon
on the desktop was a challenge until they recognized those icons, of
course.

A few still don't use the computers, but most caught on OK...
once the company spent thousands on training...

> In a free-enterprise economy, the consumers are actually who
>determines what is produced. If the above paragraph contained any truth,
>the scenario it depicts would already be transpriring.

In a loose sense, this is true. However, the comsumers determine this
by (in most cases) their purchasing pattern. And what influences their
purchasing pattern? Many things, including advertising. If every ad
you see urges you to buy the fastest and best, if all the "buyer's Guides"
tell you to do the same, if everyone you know either has the fastest
and best or wants it, what are you going to buy (assuming you are a PC
novice)? A rational, thinking person would most likely buy the
fastest and the best, not because it is what they need, but because it
is what they *perceive* as being what they need. Their perception of
their needs has been influenced.

> I suppose we could all drive VW Beetles, too. It would get us to
>where we want to go. I think I'll take a more modern approach at
>transportation. Does not the same apply for computers?

I'll say the same thing to this that I have said to the argument
that computer users don't need to understand computers because drivers
of cars do not need to understand how the engine in it operates: computers
are not cars. This may not seem like a revalation <grin>, but it seems
to escape a lot of people. :)
A car is a status symbol, not just a tool for getting one from
one place to another.
A computer, on the other hand, is only a tool. If they've
become status symbols in the minds of Americans, then we've really gone
off the deep end. :) "Oooh, he uses a Pentium! Man, what a sexy,
successful guy!" :)

Okay, time for a REAL 8-bit guru challenge...

Have you ever been listing an old commercial BASIC program on your
Atari, and come across stuff like "POKE 710,10.99843"? I used to
find that sort of thing all the time, but just figured it was the
work of programmers who weren't familiar with programming the Atari.
But a while back, I was looking through one of my own older programs,
and found a couple instances of the same blamed thing!

Soooo.... what causes this??? Anybody? Anybody?

I think it is interesting that Pentium, SVGA, 530 meg hd, CD ROM
playing, $2500 computer people are defending themselves against a 1979,
64k, 8-bit, $5 computer. This group is pretty much made up of people
who either use the machine or admire it or something and I'm sure glad
we aren't having to defend ourselves, it's the other way around.

6529. Fond Memories

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-23 03:50:11 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <Jcy3lSb.ransom22@delphi.com>
Source record: 97055

Among my favorite memories are my first experiences with
computers.
The first computer I remember seeing was when I was in
the seventh grade. The school I went to was a rather small
church-based school. The bible study classes included
students from grades seven through 12, so there was some
level of interaction among all the grades. I remember
watching one of the three people who were in
the 12th grade building a Heathkit which had been donated to
the school. When he finished it, I sat and watched him enter
the program to run a version of Lunar Lander. It was text-
only, of course, but it was great fun to watch him play it.
I didn't actually get to use a computer until a year
later, when I got my own Atari 400. Yes, it had a membrane
keyboard and only 16K of RAM, but it seemed powerful to me!
Learning basic by reading the BASIC Reference Manual and
"Inside Atari BASIC" (by Bill Caris) was a real thrill.
I programmed a "catch me"-type game in Gr. 3 as one of
my first projects. It used the joystick to move a single
block around the screen, avoiding another block as the player
moved around (and hid behind) objects on his way through the
fifteen "rooms". One problem: the screen kept blinking!
Not just the moveable objects, but the whole thing!
I called Atari's 800 number, and asked them about it.
I told them I was using the BASIC programming language to
program a game, and the objects on the screen kept flashing.
The woman told me she'd have someone call me back with help.
The next morning at around 7 AM, I got a phone call.
It was from someone who claimed to be the programmer of
BASIC. As an 8th-grader, that was quite a thrill!
I explained my problem to him as I had to the woman
previously. He said that the BASIC programming cartridge was
very limited, so he wasn't surprised at this difficulty. He
suggested I might try one of the Atari computers instead.
I told him I *was* using an Atari computer. He said,
"Don't you mean you're using the BASIC Programming cartridge
on the VCS?" I laughed a little, and replied that I meant
the Atari BASIC cartridge on the 400 computer.
He then asked how many players I had on the screen. I
naturally told him I had only one. He said he didn't
understand why it would blink with only one player, but he
would send me some information that might help me out.
About a week later, I got a manilla envelope with some
copies of Atari programming information. One was on

redefining character sets, others were on various other topics, and one was on player/missile graphics. On reading that last one, I finally understood what he meant by "Player". I wasn't using ANY players, because I hadn't even known what they were!

I went back to the program and looked it over carefully, then finally found my problem: I had the main program loop going back up to the GR. 3 statement, thus having it erase the screen and re-draw it every time through the loop! No wonder it flashed!

Since then, I've done a wee bit more programming on a variety of platforms in a variety of languages. I think I've gotten a little better at it, too. :)

But, I always remember that an actual Atari programmer called little ol' me to help me solve my piddling problem. Since we were essentially speaking completely different languages, it's no wonder he didn't understand my problem. Heck, even *I* didn't understand my problem! But the fact remains that Atari and its programmers had at least one thing going for them at the time . . . real customer service. And I'll always remember them for that more than anything else.

If you have a programming experience you'd like to share, please do! I'd love to read them . . .

I got into the world of computers quite by accident. My little brother had purchased a used 800xl back in 83 or so. I just happened to have a video game system that he wanted very much.

I ended up trading my video game system straight across for an 800xl, Xm301 modem and stock 1050 disk drive.

BEST trade I ever made!

Well, I be impressed! Didn't know this group had all these intellectual-philosopher types. Geeze, I hope this group isn't getting too high-brow for us low-lifes. ;-)

Actually I see merit in both sides of these arguments. Tho I *would* like to correct a minor misstatement made by Jeff McW. who said something to the effect that technical drawing programs for the 8-bit don't exist. Uh... technically speaking (pun intended) he's dead wrong. They do exist.

Jeff referred briefly to a drawing prog we worked on a couple years ago. It was called Circuit Master. I wrote the design protocol, Jeff crunched code (or maybe I should say, he choked on the code). Someone else hacked at it before Jeff (Chris Chiesa??) & also choked. Guess we bit off more than we could chew. The purpose of C-M was to draw high quality electronic schematics, making use of 24-pin graphics to cre{ate camera-ready art for magazine articles.

There are already 3 programs on the market that do this: Schematic Designer from Alpha Systems, Circuit Database from Elfin Magic, & Graphic Master from Datasoft. I have them all. I've used them all. And all of them are crap.

The situation on the Mac & IBM world is no better. There are plenty of offerings, most of them hideously expensive, & none which are entirely suitable for serious publishing work. 100MHz Pentiums, but nobody out there has yet written a decent circuit-drawing program. I now own as many IBMs as I do 8-bits (11 of each), but still mainly use the 8-bit since as was mentioned in the foregoing articles it does just fine for text-based applications which is 90% of what I do.

The infuriating aspect of this is that a 256K Atari with a cheap 24-pin printer could do the circuit-drawing job. It doesn't require that much CPU muscle or even a high speed processor since most of the user's time is spent laying out the circuit (50% head-scratching time). The proper program nicely done would create a sensation in the mainstream market that could make SOMEONE a lot of money. It would be nice to see it start on a Classic-8.

I've read with some amusement the call to add more features to the "free" version of PCX 2.5. Where is the free version of MicroSoft PowerPoint or Word Perfect or any of the other commercially available programs? The "pay" version is only $29.95. That's less than a new GameBoy cartridge!!

Let's get serious guys. Both Atari Classics and Current Notes will be running reviews of PCX 3.0, so you can read about it there. You will also here about it via word of mouth here and on the other telecommunications services. Darek has provided ample press releases and advertising to let us know what this program does and doesn't do. (Unlike a lot of the other people supporting the 8-bit today.)

My observation is that these demands just scare off many would be 8-bit programmers. People just give up on us since the 8-bit user base is sometimes perceived as a hostile audience. Yes, we need to alert programmers to bugs and advise them of desired features. But I think this needs to be done in a more positive way or no one will want to support us in the future. Darek has provided ample opportunity for the 8-bit user base to provide feedback on bugs, features and whatnot. How many people actively participated in that process when 2.0 was first released several months ago? Not many on csa8. Fortunately guys like Bill Kendrick and Bob Woolley did and I think that PCX 3.0 is a solid product as a result. If people enough people buy the program, it's quite possible that new features (that more than one person want) will be added (as Darek has stated).

>This isn't possible. What is possible however is Daisy Dot III..
>Graphics is harder, fonts aren't as easy to use (to have more than
>one size of a font, you have to DRAW them (unless you can settle
>with double/triple/etc. width/height)

Been there, done that. It was acceptable for some reports but the need
for more complicated documents came about.

> - ... display high-resolution, high-color graphics?
> (by high-color, I mean 256+)
>We have LOW resolution 4096 color graphics, which is damned
>nice IMO.. sure, it isn't 320x200x256 or 640x480x256 or 640x480x16m
>but it's nice for the 8bit..

I've seen some of the 4096-color pictures floating around BBSs, and
like you said, they're nice for the 8-bit. A neat trick. I love to see
programs that push computers to the limits. However, in this case,
those limits are too much for most non-static uses of high-color graphics.

> - ... access the huge amount of data available on cheap CD-ROMs?
>Via SIO2PC we can read any files an IBM can.. the interface needs
>work though (rather than type "I" drive #, filename on the PC, I
>think some extra handler should be written for the Atari for
>doing this via SIO2PC automatically! :))

Maybe SIO2PC can be extended to use the PC's VGA display as the 8-bit's
display, and the PC's sound card as the 8-bit's sound source...
see my point?

> - ... support a 38.4k modem connection, doing VT100 emulation,
> at a text res of 132x40?
>
>14.4k at 80x24 ... more isn't often needed I think.. not in text

It depends. 80x24 is OK for standard BBSing, but I use the higher-res
modes for editing and so forth where it helps to see more of a file.

> - ... process and print Postscript files on a non-Postscript printer?
>
>Uhhhh..

Most of the documents the profs give us are in Postscript, and using
ghostview on my PC, I can print them on my HP-compatible printer.
The PC does all of the Postscript processing that the CPU in a Postscript
printer would do. It takes a lot of memory and it's slow. I admit
there are much better ways to do this, I just haven't tried. So we'll
skip this one!

> - ... play the newest games AND the old classics?
>
>New games are still comign out if you wanne be techincal :)

Hmm... Simcity 2000 on the 8-bit. Maybe, on an upgraded system.
After all, the original Simcity came out for the C64 and
therefore should be possible on the Atari 8-bit.

Well, before this turns into a silly flame-fest (it's not yet,
but you know how things go) I want to say that I'm not posting
anything with the intent of insulting 8-bit users or developers.
I'm not exactly an 8-bit veteran but I used a 130XE as
my "main" computer for about a year before I needed to upgrade.
Given the price of 8-bit hard drive systems and whole PC/XTs
with hard drives then, I went the PC route.

I think there's a reason that a lot of people don't use the
8-bits anymore which has nothing to do with being sucked
in by PC marketers. I think that reason is to get a lot of
things done on the 8-bit, it takes a lot of upgrading, knowledge
of the system, and patience, which a majority of PC users
don't want to invest into the process of getting out a document or
spreadsheet, both almost trivial tasks in Windows Office (yech!) on
the usual office or home PC.

6538. PC Xformer 2.00 and 2.50

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-23 07:09:33 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <3auprd$4jr@usenet.INS.CWRU.Edu>
Source record: 97185

I have seen a lot of comments about Xformer 2.50 lately and some
software not working. I will describe my findings below. I welcome
any other comments on PC XFormer. If any of the "Bugs" have been fixed,
let me know, because I definately want to buy it - If not just for the
ability to use a real joystick.

A bugs with 2.50 (and how to fix it):
In 800 XL mode some programs that work on 2.00 don't work in 2.50 and
reset enables BASIC. A temporary fix is to patch atarixl.rom file:

At the byte 18-20,292-294,658-660, and 1138-1140 (assuming the first byte
is 1 and NOT 0), change the bytes (which are 173,13,208) to 169,0,234.
This changes "lda trig3" instructions to "lda #0 nop" telling the
computer no cartridge is present (BASIC still works).

You also MUST change bytes 1 and 2 to 29 and 146 respectively.
This changes the ROM checksum for the first 8K (not counting the first two bytes).
If this is not changed, you will boot up into memory test with the ROM
checking bad.

I sent the file to my 8bit and wrote a Turbo BASIC
program to do the patch, hopefully someone can write it for BASIC on the
PC side. I do not have BASIC on the PC side (actually I do have it on
a 5.25" disk, but the computer only has a 3.5" drive).

I had no problems with the 800 mode.

Hopefully, this bug is fixed at the emulator level on 3.00

If anyone gets this to work, let me know.

Did you know?:

Pressing ALT with the arrow keys will give the un-control key on the
Atari. This is good if a program requires use of cursor keys without
pressing CONTROL.

This may not be true of 2.00, I am not sure but on my computer you can
use:
alt-ctrl-tab for ctrl-tab
alt-ctrl-` for ctrl-inverse
alt-ctrl-esc for ctrl-esc
alt-ctrl-f6 real ctrl-1 pause
alt-ctrl-F8 for ctrl-3 (EOF)
unfornately alt-ctrl-caps duplicates HELP and not ctrl-caps

alt-ctrl with function keys each return different press, this is
more of a quirk than a feature.

Fixed in 2.5:

Player-Missile priorities don't work. Priority of missiles combined
to be a player (ie: all same color) doesn't work. In 2.50 they work!!!!

Some functions seem faster, but some seem slower particularly when PM
graphics are on - perhaps due to the above bug fix. Diagnol scrolling on
Zaxxon looks much better on 2.50

Bugs in 2.0 & 2.5

Display List interupts appear to be executed on the first line
of a mode line, instead of the last (this causes DLI color/
character set changes to occur too soon for any mode other than
graphics 8 and 7+ (Antic modes 15 and 14). This often renders
a score line unreadable as well as other screen glitches.

Changing data in a character set after the character set is
enabled will not cause the change to occur on the screen
unless the screen is written to in that area, or a Player-Missile
Graphic data appears on that row.

The control-G functions appears to return the same code as control-F.
Control-Tab performs a delete line instead of clear tab. You can use
alt-ctrl-tab however.

Specifying an atari file (not an XFD or ATR disk image) that is in another
directory will cause it to have a filename that includes the directory for
part of it: XF2 MYDOS.ATR C:\ATARI\PROGRAM.EXE will have a file
on drive 2 that will be named C:\ATARI\PR and be unaccessable.

I have had occasional problems with players not lining up exactly or
problems with narrow playfields, but these could be attributed to some of
the above bugs.

Ken Siders
cp576@cleveland.freenet.edu

I attempted to get on the umich archive, a program that will convert a
single, 1050 double, or double density disk to a disk image .XFD file
and write it to disk (assuming you have one large enough), or send it
via standard xmodem (not CRC since I don't know how the CRC code is
calculated) to an R: device. If anyone tries this program or it never
appears and you are interested, let me know. (called DISK2XFD)

I also have a newer version that will read from a disk, a diskcomm file,
Xmodem input(.XFD), an XFD file, or .ATR file and write to a disk, Xmodem
output(.XFD), and .XFD file.(cannot input and output to XMODEM at same
time obviously). The only thing slowing me down is the XMODEM recieve
routine sometimes doesn't work. This version is menu driven vs. command
line driven DISK2XFD.

b >to the effect that technical drawing programs for the 8-bit don't exist.
b >Uh... technically speaking (pun intended) he's dead wrong. They do exist.

Seems that this topic comes up every so often, and just about the same things
get said each time. "A call to arms" aside, most folk are just going to
use what ever system works for them. I needed AutoCad, I've got a 486...needed
to do DTP work for Tulane, I've got a Mac650...and just because I like
systems that have been droped by their parent company...I've picked up a
NeXT cube.

So what's this got to do with anything? Nothing. Oddly I find all the systems
just about the same...Windows, Mac OS and NeXT Step aside. They all get the
job done, and the end results printed on my letter head look just alike :>

My office has three Atari's MUX'ed to an 80 Meg server hooked to a HP550. True,
each system is now in a mini tower and has a standard IBM style keyboard via
a TransKey, but the systems do what I what them to do and the total cost was
less than a new 486, monitor, 8meg memory, Windows, WP6.0, network cards etc...

Guess that makes me a stuck in the mud die-hard. :>

As far as circuit design and printing goes, nothing AutoCad and a Calcomp
plotter can't be beat...but at 3.5K for Acad 13 and 2.5K for the plotter
I can see why you might want to keep looking elsewhere. ;>

Yup, there's absolutely sod all available for the light pen. You
could of course try and use some of the light gun games with it :)

The only package I have for the light pen is a drawing ROM cartridge.
Thing is, the cursor jumps about like a flea so it's impossible to
use it for detailed drawing (even in Zoom mode).

However, I have thought about adding support for it in some of my own
software in the future since it is very nice to use.

Aah! Fond memories- I remember years ago I wanted a Sinclair ZX Spectrum 128K, this was about 1986, but I couldn't have afforded it all myself, so my Dad was going split the cost with me. Yipee! Then he got a shot of a computer off someone he knew. Atari 800XL- it rang some faint bells, but I'd never seen one in real life, and had never seen one running. The first game I saw was Elektraglide, by English Software. It took ages to load, and the title page with its tweening graphics was impressive. Anyway, to cut a long story short, when I saw the game itself running I was absolutely gobsmacked! I'd *never* seen anything nearly as good on a Spectrum. So guess which computer we ended up getting...! I also have memories of being annoyed when I discovered how little software there actually was available, but all said and done, Elektraglide was so *cool*, and the games I ended up getting were pretty good!

: like you said, they're nice for the 8-bit. A neat trick. I love to see
: programs that push computers to the limits. However, in this case,
: those limits are too much for most non-static uses of high-color graphics.

Wow! How do they do that? Pity I can't download stuff from the net due to
only having a 1050 drive (I can't transfer the files without at least an
XF551 or so I've heard).

: >New games are still comign out if you wanne be techincal :)

: Hmm... Simcity 2000 on the 8-bit. Maybe, on an upgraded system.
: After all, the original Simcity came out for the C64 and
: therefore should be possible on the Atari 8-bit.

SimCity 2000 on the Amiga requires 4mb and a hard drive. Even on an upgraded
system how much memory are you going to need. Also apparently, because of
the speed of the game, you need a reasonably accelerated Amiga to run it on.
How slow is it going to be on the XL/XE? Simcity? Yes. Simcity 2000? I think
not...

Despite my dislike for bloated PC software, not helped by the inclusion of
features which will never be used by most people, you can still do more with
it than you can with a 48K 8-bit Atari package. Sorry, but that's the way it
is. Can you do it as well, and as easily? I've heard for things like DTP, you
require *at least* 6 megs to do it properly. Sure you could have an 8-bit
Atari expanded to 8 megs, but doesn't that totally defeat the argument about
only needing small machines?

This isn't a criticism of the 800XL, but when I use it these days, I use it
for its strengths and not it's weaknesses.

```

A HA! I think you put your finger on the problem! I was using --BOTH-- a single density 810 --AND-- a double density XF551. Obviously I didn't step the XF551 down to single density by performing a "show directory". I was probably also pointing to "D1:" for my read test, and it was probably still in double density. There is no mention in APPENDIX 11 of "Mapping" that Disk Density is a factor. Of course, that goes without saying that it is single density since SEC$(128) is DIMed and 128 is used. Still, it would have been nice if the author had spelled it out explicitly. Hmm... I wonder why no ERROR was generated ? If I remember correctly, my disk just spun and then nothing happened? Hmm... there probably was an ERROR code sitting in the STATUS register. I don't remember whether or not I had to reboot (in which case error handling wouldn't have executed anyway...). Thanks for the tip! It is obvious now that you point it out. Time to try it again....

Here here, Rick! >I'll< be one of the first folks knocking on Darek's
door with bugs, quirks, etc. about PC XF 3.0 (and its docs <grin>)
but I'll just say this:

Player Missile Collision detection

W O R K S ! ! !

When I first got a copy of 2.5, I tried playing Rubberball with it but
alas, the damned ball fell through everything.. I loaded it up today
in 3.0 with much anticipation and it WORKED! It acted a bit funny for
a few reasons though: 1) I was using a slow 386 so it wasn't as fast
or responsive as it could be 2) I forgot that the fire button pauses
the game and from that, 3) the joystick emulation was odd (I've noticed
this in the console key responses, too.. maybe Darek should make a keypad
which plugs into a COM port that does Start/Select/Option/Fire), so I ended
up getting stuck literally frozen a couple of times.

Just to add another note: somebody said something about it not emulating
Shift+Control key combinations. Well, I loaded up BobTerm and hit s+c+E
and the edit buffer came up! Whoever was complaining must either have
2.5 and 2.5 doesn't support it, or has a weird PC keyboard..

anyway, I'll shut up for now.. look for a new revision of my Emulator FAQ
coming out pretty soon!

Hey! Cool! Thanx for those tips and suggestions. I hope Darek is listening in. Are you planning on purchasing 3.0? Some of this may be fixed in that.

On another note, I was thinking to myself "one sneaky cheat to speed up the screen writes in PC XF is maybe to write to every other pixel per frame" .. ie, if text appeared where there was none before, it'd look checker-board dithered at first, and by the next frame it'd be solid.. this is comparible to how Interlaced GIFs work.. rather than seeing the screen from top to bottom, you see a small percentage of the whole thing, then a little bit more, then a little bit more, and finally the whole 100% is up on the screen. It takes as much data and time to load it as it does if you were to view top to bottom, but you actually see more of what the image will look like before it has been loaded....

Any ideas I have are just BS until new products hit the market. That being said: What I'd like to see is things going a little retro before going forward. For instance, I believe CSS was modifying 800xl's to make them 100% 130XE compatible by putting all the 130XE circuity on the mother board. I've talked with Mike at FTE & he didn't seem to think there was a problem with cloning the XE MMU. I've paid up to $13 for those chips, but I'm sure FTE could do it for $1-2+ whatever their overhead is. With the cut/jumping of one trace on the mother board you can decode all chips in the xl/xe series to only use the bottom half of the page. This would free the top half most hardware pages i.e. [$D380-$D3FF, $D280-$D2FF] for additional chips. The new chips can either be added to the mother board or hung on the PBI. My wish list from there would go something like: Software/Hardware bundled together just like ICD did with the Sparta DOS construction kit so every one could plan on having a uniform platform. As a minimum you could expect a 130XE, at best you could expect things like 8 bits of banking at $D300 so you could access 4 megs of banked ram in addition to the XE banks. For other chips like the stereo upgrade or Wooley's 2 GTIA chips I'm not so hot on the idea. They aren't making any more of these chips so I'm in favor of using off the shelf parts. Maybe a 6551 or better but more expensive a 2681 serial chip on the buss. Really, the 6551 would be sufficient & it's at least $15 cheaper. Whoops! That was $D380 above for the 4 megs of banking. As long as you're adding latches, a printer port would be nice. I really do not feel strongly about where the chips go, for instance the MIO take the $D100 page so it could be left alone, but some things wouldn't be to difficult to implement given the right tools. Doing stuff like switching the OS to ram & installing a new printer handler in the RAM OS would be a snap. I guess the down side to this is the whole package ends up being a huge task. We may not have the horse power left to do it. It's really late, this should have been done circa 1984-85 by Atari. Those guys had revenues of up to $2.5 billion/year & didn't spend it where it should have gone.

Actually Ben, you should give a look at Easytrak. It has two programs EASYEDIT.EXE & EASYPLOT.EXE that are fantastic. I downloaded them from the JDR bbs. The only complaint I have is you can't force the autorouter to go in single sided mode. If you're willing to add the traces by hand or can do a double sided board it's not a problem. The programs support just about everything from a CGA/Herc XT to super VGA Pentiums. Printer support goes the same, FX80 to HP/Calcomp plotters, Postscript, Gerber, you name it. I believe it's from England & the full version is $200, but I really can't imagine what else they could add. Even though this is a freeware version I will probably try to send them some bucks if I ever make a board<g>. After trying this program out, I wouldn't even let my dog sit on PC Board Designer for my ST, it's that much better.

Nope, I have both Omniview & Omnimon on the Newell OS board. Never bought 3.2, got a copy of 2.3 with a US doubler & went straigth from there to 4.19. I seem to be a little out of sync, buying the version just a little too soon but trust me on this. 2.3 crashes badly with Omnimon. Maybe someone misspoke, but I think what they were trying to say was look for ROM at $C000 on an 800. I have a copy of Movie Maker & it doesn't run with anything in my xl but a standard OS. I can only guess it computes a checksum. I never use the program so I never bothered looking into it's copy protection scheme.

Read the book, The Home Computer Wars, it covers this
very topic in great detail. (It's a good read too)

Anyway, Jack Tramiel was a brilliant business man at
Commodore. He was always knocking down prices to the lowest level,
and bringing out great hardware at incredible prices. Also, Commodore's
vertical integration didn't hurt...they owned the company that made
their microprocessors which cut down on prices tremendously. This
is what TI did to get their calculator prices down so low, which forced
Commodore out of the calculator business and many others into
bankruptcy.
The VIC-20 and Commodore 64 set new standards for computers
at their price levels. They had tons of features found on more
expensive computers, and had really cheap peripherals. For instance,
they thought it was impossible to get a modem down to $100, but
Commodore did it, and introduced the VICMODEM at roughly $100.
Their in-house software developers worked 'round the clock
to get VIC-20 games out for the introduction, and their deal with
Bally got them some hot game lisences. They had wide distribution,
and were always able to cut the price below all the competitors.
Jack did make some bad decisions, such as the Commodore 16/+4
and the UltiMax (which, thankfully, he was convinced not to produce...
he dumped the initial 10,000 units on Japan) before he left Commodore.
At Atari, they haven't been as successful. I think that
they didn't change their business strategy to update with the modern
market among other things.

Yeechang Lee <ycl6@ciao.cc.columbia.edu> writes:

>that the Atari 8-bit systems _were_ more advanced technically (more
>colors, real DOS, better disk access, better BASIC, etc; C-64 only had an
>edge in sound, absolute video quality [chroma/luma separation] and maybe
>sprites vs. P/M). I don't know about other people, but where I grew up

Just my humble opinion here, but Atari had the C-64 beat in terms of sound,
and equalled it in video quality (on the 800 and XE lines, anyway, as
they had chroma/luma separation). In terms of sprites versus P/M, I have
to say commodore's sprites win out.

As to the overall issue of why Commodore succeeded where Atari failed,
I'll offer the following as *some* of the reasons. These are my opinions,
based on reading Antic, ANALOG, Compute!, and various other resources
produced during the era (including 'mainstream' magazine articles and
newspaper columns).

One thing that really hurt Atari was Warner Communications. They just
didn't know how to run a computer company. Atari's early creations
(the VCS and 8-bit computers) carried it through the years when those
devices were clearly superior. Later on, their lack of marketing
caught up as low-price alternatives began to appear (the Commodore for
one, and the TI 99/4a for antoher) and the bloody price wars began,
which were essentially ended (IMO) when TI dropped the 99/4a line
and dumped them at prices that allowed retailers to sell them for $49
each.
To get back to Warner, they put people in charge of the company
who didn't understand the business. Raymond Kassar knew nothing of
electronics. Mr. Morgan likewise didn't know what he was doing. The former
was from the textile industry, and the latter from the tobacco industry.
They proved without a doubt that computers can't be marketed like
most other products. This is especially true of the time they were marketing
them, when most of the population was even more ignorant of computers than
they are today.
Instead of recognizing that the videogame market and the computer
market were one and the same during and after the price wars (when
the price difference between computers and videogames evaporated), Atari
tried to do both, segmenting its audience and competing with itself (esp
in the case of the 5200).

Another "helping hand" in the downfall of Atari were the magazines,
such as Antic and ANALOG, which printed more negative comments about Atari
than was sensible. From editorials expounding on the poor products produced,
to feature articles detailing the rampant pirating, they did a lot to
scare consumers AND software producers away from the market.

I was never in the Atari pirate scene, so I can't say for sure
how bad it was. However, I was involved in the Apple][pirating
scene, and know thatAtari's couldn't have been worse. It just couldn't
have. Yet, the Apple][line lasted far, far longer than did Atari's
(as far as profitable years is concerned). Yet, ANALOG in particular
claimed that the reason games took longer to come out on the Atari
was because of the "rampant piracy" in the Atari community. I'd bet
that companies read those articles just as we did, and came to the
conclusion that the magazine writers must know what they're talking
about, and THAT is what led to the lack of programs in the post-83
Atari era.
Again, these are just my opinions. Possibly I"m way off,
but until I learn otherwise . . .

-Joe

Jack Trammiel managed to undercut everyone, including Atari. I remember that advertising wasn't as good as some of the competition (a problem, even then!) and the Atari computers weren't in as many stores. The 8-bit Atari was technically superior, though.

|they had chroma/luma separation). In terms of sprites versus P/M, I have
|to say commodore's sprites win out.

I didn't realize Ataris eventually gained chroma-luma separation.

I'd always understood Commodore's SID chip to be better than the Atari's
(another voice, better waveforms) but am willing to be corrected.

I think one thing Atari could've done better was promote its machines'
128-color capability, something unequalled on micros 'till the Amiga's
HAM mode in '85. Tech specs, then as now, impressed people.

|Later on, their lack of marketing
|caught up as low-price alternatives began to appear (the Commodore for
|one, and the TI 99/4a for antoher) and the bloody price wars began,

You might have something there--Atari never really got into the price
wars, not 'till Tramiel (a veteran of them of course) came on and dumped
excess XL-series machines onto the market, right?

|which were essentially ended (IMO) when TI dropped the 99/4a line
|and dumped them at prices that allowed retailers to sell them for $49
|each.

I still remember Toys 'R Us's TV ads advertising this, in late '83.

|than was sensible. From editorials expounding on the poor products produced,
|to feature articles detailing the rampant pirating, they did a lot to
|scare consumers AND software producers away from the market.

Again I'm not familiar with the Atari magazine market, but certainly
Commodore-related publications weren't shy about excoriciating West
Chester when deserved, either. The Plus-4 and the C16 were (deservedly)
killed by massive amounts of bad press, for instance.

|how bad it was. However, I was involved in the Apple][pirating
|scene, and know that Atari's couldn't have been worse. It just couldn't
|have.

I assure you, the Commodore pirate market was just as bad! "Fast
Hack'Em!"

|Yet, the Apple][line lasted far, far longer than did Atari's
|(as far as profitable years is concerned).

Another possible thread to explore--was it because of a more "serious computer" image, greater expandability, or simply a greater financial incentive for Apple owners to stick with their machines?

In article <3b002v$2mt@nic-nac.CSU.net>, kendrick@zippy.sonoma.edu (William Kendrick) writes:

[Just to add another note: somebody said something about it not emulating Shift+Control key combinations. Well, I loaded up BobTerm and hit s+c+E and the edit buffer came up! Whoever was complaining must either have 2.5 and 2.5 doesn't support it, or has a weird PC keyboard..]

Btw, are you able to use Bobterm on Xformer 3.0 consistently? When I run "xforemer -c1", Bobterm finds the serial port. But, it seems like I'm only receiving characters when I type them. Like I type "AT <control-M>" and nothing comes out. But If I bank on the keys, I'll eventually see the "OK" come out as I press each key.

Bobterm worked once for me, as I was able to phone my BBS at 300 Baud. But, I'm still not sure exactly what I did to make it work. And now, I can't get it working again. (Gonna' try some other modems.)

I still haven't had a chance to put games on Xformer.

6564. Help with Adaptec Controller

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-24 01:59:15 UTC
From: BRYEDEWAARD@news.delphi.com
Message-ID: <3b0s1j$spe@news2.delphi.com>
Source record: 96926

I recently picked up an Atari SH204 Hard drive, and it uses an Adaptec controller to access an MFM (ST225) drive. I ran the SCSI cable to my MIO, but the drive won't verify after a format. It says "block header bad". I noticed that the controller has an Atari EPROM instead of an Adaptec one, so I imagine Atari has crippled the conroller for ST-dedicated use. Can anyone get me either an EPROM or a file to make an original Adaptec EPROM? I'm not sure at the moment which controller it is, but it's as big as a 5 1/4" drive.

-Thanks!

6565. Re: Why did Commodore beat Atari in the 8-bit market?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-24 02:57:50 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3b0vfe$eit@nermal.cs.uoguelph.ca>
Source record: 97197

: I'd always understood Commodore's SID chip to be better than the Atari's
: (another voice, better waveforms) but am willing to be corrected.

I don't know about the wave forms, but the Atari 8-bits had four
seperate voices, wheras the SID chip only had three. The range was
greater on the SID chip, but you could POKE 16-bit sound out of the Atari
that would give you three voices with the same range as the SID.

: I think one thing Atari could've done better was promote its machines'
: 128-color capability, something unequalled on micros 'till the Amiga's
: HAM mode in '85. Tech specs, then as now, impressed people.

128 until 1981, then the GTIA chip came out and the pallette
doubled to 256 colors.

: You might have something there--Atari never really got into the price
: wars, not 'till Tramiel (a veteran of them of course) came on and dumped
: excess XL-series machines onto the market, right?

Not true. Whenever a machine was about to be replaced, the older
Atari computer would fall in price. When the 800XL and 600XL came onto
the market, the 400 and 800 prices shrunk away.

: Again I'm not familiar with the Atari magazine market, but certainly
: Commodore-related publications weren't shy about excoriciating West
: Chester when deserved, either. The Plus-4 and the C16 were (deservedly)
: killed by massive amounts of bad press, for instance.

I don't know much about these machines. While the C64/128,
VIC-20, and Amiga computers hit, it seems like quite a few Commodore
computers missed ... Plus/4, Plus/16, c16, MAX-2 etc. Wonder why this was?

: |Yet, the Apple][line lasted far, far longer than did Atari's
: |(as far as profitable years is concerned).

Well ... about three years, anyway. The Atari market's final big
year seemed to be around 1986 or 7.

Cheers,

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <128081@cup.portal.com>
Source record: 97198

Well. I haven't been on much the last few months, and I missed the original "Call To Arms" post entirely, but this is a GREAT discussion!

Reminds me of the night one of my uncles tricked my Mom and me into attending an Amway proselytizing meeting.

Those poor bastards tried for three hours to set their hooks in me, but alas they were using the wrong bait. Someone here has said (to paraphrase it loosely) that "a thinking person will buy the latest and greatest because he *perceives* that it is what he needs; his perception of his needs has been influenced." Someone else added to the "computers / cars analogy," saying that "if Car A and Car B both get you to your destination, only Car A is more comfortable ... and looks better, which one are you going to buy? Car B because it's cheaper? I don't think so!" More or less. Well, MY take on all of this, for what it's worth, is that a TRULY "thinking" person ought to be AWARE that his perceptions are being manipulated, and ought to be able to disregard said manipulation, and make his purchasing decisions based on more practical considerations. Likewise, if Car B is cheaper and gets you to your destination at the same speed as Car A, the only rational course is to buy Car B -- all other reasons for preferring Car A are emotional ones. This point completely escaped those Amway people, as they tried in vain to woo me with visions of all kinds of latest-and-greatest material goods -- "surely you've gone to a car dealership and sat in the seat of the latest models...?" "Nope." "Then surely you used to sit in your Dad's car and dream about having a car of your own..." "Nope." Etc. etc. ad nauseum.

I put it to you that several (though by no means all) of the posters to this thread also miss this crucial point: that it IS possible to live without the latest-and-greatest of everything -- even of ANYTHING -- and to deliberately DECIDE to "buy Car B," and to believe and be able to defend the philosophy that this is the Only Rational Course Of Action (though I would never put it so religiously; the only objection I have to your believing differently than I, is that there are MORE of you than there are of me, with the result that, as time goes on, there are fewer and fewer products made which I am willing to buy as time goes on. I forget who first said it, but one of my favorite Truths is this: "nobody ever went broke underestimating the taste of the public." Substitute "intelligence" for "taste" and it remains just as true.

That's my 2 cents' worth. Oh, and I own an Amiga 1000, several Atari 8-bits, an AT&T 3b1, an Altos Xenix system, and a couple of other odds and ends. One and all are obsolete, most were orphaned by their manufacturers shortly after, or in some cases BEFORE, I acquired them, AND I might purchase a PC at some point in future time IF I were to perceive a practical, put-my-

finger-directly-on-it-and-it-doesn't-disappear, need for one -- but that moment is not now and shows few if any signs of approaching. A couple of non-Internet friends and I, here in the land of Bob Puff, still have a grand old time hacking around and programming and modifying old software to fit our needs, on the good ol' Atari 800XL.

Oh, and yes, I _was_ the other person to nibble and choke on Circuit Master, as Ben Poehland stated. Sorry, Ben. :-(

You're probably looking for the Atari 820 printer. I picked up a brand new one from Best Electronics in CA a few months ago and use it for mailing labels and screen dumps. It's actually pretty quick [compared to my 1025] and the print quality is not bad [looks kind of like one of those old dot-matrix cash registers].

My guess is Best still has a stock of them.

Source record: 97199

Ye gods, I could fill a small book with my computer memories, particularly if I go all the way back to hunting-and-pecking on a glass-enclosed tele-type unit at some kind of science fair back in the early Sixties; I was about five years old and my Dad couldn't pry me away from the thing. He still has a photograph of me standing there mesmerized.

I can cut it down by limiting myself to microcomputers, from the mid-70's (my early teens) on. A friend's father was an electrical engineer and used to bring home all kinds of stuff which, in retrospect, his company must have been training him in using. My friend and I, being the ever-so-careful, "nerd" type, were allowed to play with these things occasionally. One time I went over there and my friend was playing with a little unit consisting of a circuit board with two seven-segment LED "digit" displays, eight toggle switches, and four pushbuttons, on a circuit board. If you looked through the accompanying manual you would find lists of two-place number-and-letter combinations, which you looked up in a table to determine the corresponding on-off pattern of the eight toggle switches, set that up, and pressed one of the four pushbuttons. You would put in a whole list of numbers that way, then press one of the OTHER buttons, and suddenly the display would "count upwards from zero," or "count down from the number represented by the switches," or some such simple task. It was completely fascinating and completely mysterious, and I had no idea how it worked. That was around 1975 or 76 as I make it, and it was only in 1982, in a Microcomputers course in my second year of college, that I suddenly realized that we had been reading machine-language program listings in hexadecimal, translating them into binary, setting the bits via the eight switches, and poking them into memory to form a program!

That was at RPI and there were already a smattering of personal computers in student dorm rooms. There were Apple IIs and Atari 800s and a whole slew of oddly-named off-brand :-) computers. Interestingly enough, there was a scholarship program going on at that time and place, which consisted of giving students with sufficiently high SAT scores :-) complete Atari computer systems: each recipient received an Atari 800 computer "fully] loaded" with 48K RAM, two Atari 810 disk drives, an Atari 850 Interface Module, an Atari 830 (300 baud) modem, an Epson 8-pin dot-matrix printer, and a TV set for monitor (yep, they all got TVs into the deal). I prob-ably would have qualified, myself, but only applied to the school at the last minute and so was not even CONSIDERED. It's just as well, though, because you only got to keep the system beyond your senior year if you ACTUALLY GRADUATED, and as it turned out I did NOT. :-) Rather, I made friends with several of these Atari-given folks -- one of them became my girlfriend for the next three or four years :-) -- and programmed on THEIR systems. This, more than anything else, was what decided me when in 1982 I finally decided to spend the then $1000 needed for such a system, and

had to choose among Apple II, Commodore 64, and Atari 800. (That, plus a little "running horse" demo I saw at a computer store. I still have that program; it's in BASIC, and uses redefined characters PRINTed in Graphics 0. Oh, and the horse has a FIVE-beat gait. :-))

I could throw in here how I taught myself BASIC from a book in the high-school library before ever having a computer available on which to TRY any of it, or how my BASIC version of LIFE on the school's ancient IBM mini (which had a whopping 4K of real magnetic-core memory) was so slow they would only let me run it an hour after school had let out, or about making friends with the manager of the local Radio Shack store and having him let me come and "work" on the store's "demo" model TRS-80, and my Mom having to telephone the store to get me to come home for dinner -- but this message is long enough already and I've probably told most of these stories here before anyway. :-)

I agree with the original instigator of this thread, though, that my early computing memories are among my most cherished.

I've never used it, but was warned when I bought my 1200XL to stay away from it and wait for AW. Even the Atari catalog I have looks like they had a hard time saying anything good about AWP [it came with a bunch of disks, a workbook, and a training program]. Comparing that to AW [which got me through Jr High, High School and part of college] - it was easy to use right out of the box. I can appreciate the fact that you're nostalgic for it though. I picked up an 830 acoustic modem a few months ago...

You can remedy this to some extent by adjusting the color of the background;
if I remember correctly, darkening the background reduces cursor jittering,
but it still jumps quite a bit -- much like a stylus behaves on a touchpad.
The software should have incorporated a feature for smoothing out lines.

Yeechang Lee (ycl6@ciao.cc.columbia.edu) wrote:
: I didn't realize Ataris eventually gained chroma-luma separation.

They had it fromt he start (Atari 800). But we all know that most XLs don't have chroma/luma and these are the most common units in service today. This was an engineering snafu. I'm sure in theory they wanted to support chroma/luma. I think Atari saw the monitor jack as a waste of time. In 1979, they designed the Atari 800 as an expensive personal computer, but the XLs were cheaper machines for a world which had changed, and they felt like they could cut corners. Not to mention that they assumed that few users would buy a monitor. I betcha that Warner's Atari could have made some good bux selling monitors like C= did if they had ever got off their asses and sold some. Then that would have validated more attention on the video monitor output signals.

I agree that the 5200 was a big mistake, that an XEGS-type unit should have appeared instead. We can only guess how that might have changed the market. Obviously C= never made a game console from their machines until the CD^32. Kinda full circle because the Amiga was originally designed as a game console.

Also by 1983 the Atari 8-bit archetecture was already 4 years old. By the time they went to 64K, with RAM prices finally coming down, THAT was the time to start revizing ANTIC/GTIA for multicolored and 80 collumn text modes, 4 color (at least) 320x192, and 16 color 160x192 or some such. Limiting the system to 8K screen RAM was no longer that important, and certainly not with the XEs where you had ANTIC BANKING which, in theory, could provide for a 64K video mode, having ANTIC look solely to banked ram in parallel with the CPU looking to main RAM.

C= and Apple both graced their 8-bit machines with about as much attention as was possible, with the C=128 and the AppleIIGS respectively. The Atari 130XE is by far the most pitiful of the three in terms of amount of meaningful improvements, in fact there were problems (the keyboard, ECI+Cart vs. PBI, soldered chips vs. sockets, etc..)

Apple and C= still gave their 65xx(x) machines the enhancements that the preexisting userbase wanted. Sure, they also offered 68K machines, but they didn't just shove their old userbase aside like Tramiel virtually did with the ST.

There was a magic moment in the mid 80s, when an 8-bit machine could FINALLY be enhanced to the limit for a good price. That is when the C=128 and AppleIIGS were made (or even the CoCo3). There was some overlap between the 'critical mass' for 8-bit machines and the dawn of the 16-bit machines. It was essentially do or die for Atari and they chose to let

the 8-bit sit. So it really didn't MATURE the way the others did. It is still a 1979 machine. Any accolades it receives now should be taken in that context, and treated differently from someone lauding over an accellerated AppleIIGS or C=128 or CoCo3 running OS/9.

When you compare the Atari 8 bit to the 64, you have to realize that the 64 was inferior, but had the features that look good to a public unlikely to know the difference.

1st, the 64 had multi-color sprites, and these could be drawn in high resolution. Matter of fact, the 64 was much more flexible in with its 320x200 gfx because it decoupled the pixels from the color clocks. This meant that contrasting colors could be placed adjacent to each other even though the pixels weren't wide enough to occupy an entire (or even half) of an NTSC color clock (the smallest width screen area that can represent any color). Of course, these pixels weren't always accurately colored (Commodore called it "chroma noise") but the higher resolution freedom with color and lower price attracted game designers.

The Atari on the other hand, was a better piece of whole system design. First of all, you had true raster-mapped pixels for all graphics modes, several styles of monochrome and color text modes, and the ability to mix horizontal bands of these modes in any configuration you wish onscreen with no CPU intervention. You can set interrupts on as few or as many scan lines as you wish, and you can read video from any area of system RAM. The Atari "Players" (sprites) were only single color, but had re-assignable priority, Luma transparency (over high resolution graphics), and selectable overlap lensing. Oh yes, and the Atari could generate 16 colors in 16 shades (256 colors).

Plus the fact that the Atari could auto-boot OS extensions or other software made it better for "real world" applications (you got NO disk utility AT ALL with the commodore 1541 drive!) but most 64s were sold as upgrades from a floundering video console market, I suspect. The Atari was designed to be connectable, and the 64 was designed to be cheap to build. If Atari had understood thier product better, maybe they could have shown the public the difference, but instead, they began a long and fruitless campaign of repackaging the same hardware to gain newness in the market. The 64 remained old-looking, ugly, and the hottest selling home computer on the market.

Go figure.

>Atari era.

Well, Apple managed to attract people with a professional angle which
tended to tie computer owners to their dealer. This caused a better
defined distribution channel for software IMHO. Most people who carried
the Atari weren't into much service-after-the-sale, so people fended
for themselves. Plus, the serious apps often attracted the Apple to
the adult market instead of a toy for the kids, so I think the Apple
user was more likely to be able to afford software.

Hi

just a note to let you know that closer2.brisnet.org.au now has FTP up and running on a 24hr basis.

the system is running under OS/2 so you will be landed in pub\incoming as this is the only directory with write access..

atari 8 files are in pub\archive1\8bit and file descriptions are contained in the file "files.bbs" as this directory is shared by a OS/2 bbs system.

Atari ST files are in pub\archive1\atarist

also note the ls and ls -l do not function properly under OS/2 use dir and redir

there are NO TELENET services available.....

email fileserver will be up and running shortly as well (fingers crossed!)

any problems access this system then please contact me via email....

cheers
dave

Atari got its ass kicked by bad management and bad marketing of a sort that was not equaled until NeXT.

Price/performance curves have been very aggressive since the early 1970s, yet Atari failed to keep up. Instead, they maintained the same ridiculously high pricing in the expectation that their technical superiority would make the difference in sales ($700 for the 1200XL?!?).

That technical superiority rapidly eroded. They never used a faster clock speed; the 130XE was just as slow as the 400. The only significant advance was the GTIA.

Yeah, it was nice to have the extra RAM in the 130XE, but an 800 with third-party memory had more, and a RAMdisk isn't all that interesting. Why didn't they move the entire DOS and ROM-based OS out, except for vector points that switched memory banks as needed? It was pretty silly that less than half the address space was available for programs by the time the OS ROM, DOS, and the cartridge got through with you. [You're talking to a fellow who hacked his 400 with 48K memory card to be 52K.] It should have been possible to give a user as much as 60K for program space.

What about the lame disk drives? A lot of people bought Happy just to get the improved performance (and then there were the asshole developers who deliberately tried to screw people with Happys).

Atari had some amazingly good promise when it started, but failed utterly to follow up. Remember the courseware? The drawing program? What about peripherals which only ever were used in one application (the paddles? the light pen?)?

Atari under Warner decided that they didn't have a computer with the 400/800, but rather had a games machine. I approached an Atari bigwig in 1981 or 1982 about developing some commercial applications, and was rather rudely told not to waste his time, games were the only thing that was of interest to them.

And such games! Remember ET, easily the worst computer program ever written? Atari was largely responsible for the collapse of the entire video game market in the mid 80s, by flooding it with shoddy games.

One need only take a look at the early Atari software offerings and compare them to what followed to see how badly downhill Atari went. Oh, there were exceptions, such as Donkey Kong (hi, Landon!) but those only proved the rule. Innovation got tossed out the door.

Once the ST came out, it was clear that the 8-bitters were dead.

Too bad, too. I picked up a 130XE and a couple of 1050s a couple of years ago, just for old times' sake. Still cute machines, even though I hardly ever use them except for an occasional game of Donkey Kong. I wish I knew why the RAMdisk feature stopped working, though (I had to disable it otherwise I could never get to DOS from BASIC. It used to work).

```
------------------------------------------------------------------------
AS02 [1.07] - Assembler for M6800/6801/6802/6803 microprocessor.
AS05 [1.07] - Assembler for M6805 microprocessor.
AS09 [1.07] - Assembler for M6809/H6309 microprocessor.
AS65 [1.07] - Assembler for 6502/65SC02 microprocessor.
AS80 [1.07] - Assembler for 8080/8085/Z80 microprocessor.

Available from:
- oak.oakland.edu: /pub/msdos/crossasm/as??_107.zip
- and the Simtel mirrors.

Common Features:
- fast two-pass assembly.
- supports binary, s-records or intel-hex output file formats.
- three segments (code, data, bss) for ROM-based programs.
- 'struct' keyword for easy declarations.
- instruction cycle count in listing.
- full conditional assembly.
- C-style expressions, accept base 2...36, using either % and $
prefixes or <base>#<value> format, 32-bit calculations.
- runs under MS-DOS 3.x or higher.

New in version [1.07]
- corrected some error messages.
- fixed ALIGN to emit null bytes in data segment.
- fixed reported bug in checksum of some generated S-records.
- generates debug information file if -g specified.
- more strictly checks for overwriting previous code.
- now accepts = as synonym for SET.
- now also checks for .asm extension to source file name.

Why would somebody buy this thing second-hand? Hear in Holland I can get an atari lynx new for fl 50,- (or about $25-$30). The problem is that the atari lynx isn't really sold any more. Now the shops are trying to get rid of them, and you can buy them for almost nothing!

Chide Groenouwe.

Just a guess here, but the expandability is what attracted the homebrew-type
hackers to that machine. And once you have them in your fold, great software
and hardware is soon to follow, which brings in more consumers . . .

Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,alt.folklore.computers

[This is a repost of something I posted to comp.sys.atari.8bit a few days ago, and which has prompted a very interesting thread there. I have superseded the original article, adding comp.sys.cbm to the Newsgroups: line. Again, I _do not_ want to start an "Atari vs. Commodore" flame war--just analyze the historical trends of the Great Computer Wars of the '80s.-YL]

. . . Of course, it's all a moot historical point now, but I'm still curious about the above question.

I admit it: I was a devoted Commodore user, both the VIC-20 and the C-64. Loved them, too; they were great machines. However, it's clear in retrospect that the Atari 8-bit systems _were_ more advanced technically (more colors, real DOS, better disk access, better BASIC, etc; C-64 only had an edge in sound, absolute video quality [chroma/luma separation] and maybe sprites vs. P/M; most importantly, however, was the _price_). I don't know about other people, but where I grew up (NYC), I hardly knew anyone with 8-bit Ataris, while everyone seemingly owned a Commodore. Even when both platforms started getting overwhelmed by the MS-DOS onslaught (N.B.: I've owned the Tandy 1000 I'm typing this on since '88), the Commodore market lasted longer than the Atari one.

Why? What was the big Commodore advantage? Was Jack Tramiel really that much better a marketer? (Indeed, I'm curious as to what is the consensus on Tramiel's tenure with Atari, after he was forced out from Commodore.) How much was Atari hurt by its changes in ownership (Warner-->Tramiel) and the Great Video Game Collapse of '83? Did Commodore have better software, and how much was this a result of Commodore's greater popularity? Did the 'video game company' image hurt Atari, period?

It's funny; I almost went the Atari road, anyway. It came down to buying an Atari 600XL or a VIC-20, and I'm sad to say that my family went the less-expensive road--but hey, $100 counted for a lot for us, back in December '83.

Anyways, let's do some real historical analysis of the home computer market of the early and mid '80s. I do _not_ want to start a flame war; instead, let's post our own recollections and feelings about an era in which so many of us got started with our computer hobbies.

(Crossposted to comp.sys.atari.8bit, comp.sys.cbm and alt.folklore.computers; followups to comp.sys.atari.8bit and comp.sys.cbm)

Some might argue that a 1200XL was almost 2X as fast as an Apple II for
half the cost. Atari culd have maintained those prices had they done
the marketing.

>That technical superiority rapidly eroded. They never used a faster clock
>speed; the 130XE was just as slow as the 400. The only significant

I agree that Warner gave up on the computer line early on, and the
Tramiels were just buying time for the ST with the XE. Freddie was a
neat idea had it caught on, though.

>Yeah, it was nice to have the extra RAM in the 130XE, but an 800 with

In the early days no one thought you'd ever need all that RAM, and later
the machines were considered "set in stone". Too bad too. An OS switched
parts of itself out would be pretty nifty.

>What about the lame disk drives? A lot of people bought Happy just to get
>the improved performance (and then there were the asshole developers who
>deliberately tried to screw people with Happys).

Ever use a 1541? Atari had a surprisingly good drive design and a common
port for all accessories. Other machines used a different port for each
device. People bought Happys to copy software.

>Atari had some amazingly good promise when it started, but failed utterly
>to follow up. Remember the courseware? The drawing program? What about
>peripherals which only ever were used in one application (the paddles?
>the light pen?)?

Again, producing these items wasn't the problem. The problem was that
Atari's marketing didn't rally much of a variation in third party

support.

>Atari under Warner decided that they didn't have a computer with the

I doubt anyone at Atari knew what their official market stance was.

.....
>Once the ST came out, it was clear the 8-bitters were dead.

The market was lost long before that. Warner started using Atari as a
write off until it went bankrupt.

No, the SID has 3 voices with 12bit pitch resolution. Pokey has 4 voices
with 8 bit pitch resolution or 2 voices with 16 bit pitch resolution (or
mix the two: 3 voices - one with 16bit, two with 8bit.)

There's much conjecture over this. When I first heard about the C64
and its infamous SID chip I was pretty amazed (I didn't have my Atari
at the time). The SID was developed to allow the C64 to have speech
in its software.

However, a couple of years ago a C64 owning friend showed me a C64
programming manual and in it were the words ... 3 sound channels and
1 noise channel. This does seem to bury the myth a bit!

>
> I think one thing Atari could've done better was promote its machines'

Ahem. Surely you mean its 256-colour capability? ;-)

One thing you are right about though is that tech specs impress
people. That's why I opted for an Atari rather than a Commodore. As
time has gone on and I've discovered more info about the C64, I've
come to appreciate the Atari even more.

For example, the Atari is the faster of the two machines and is
easier to program, so you can imagine why so many Atari users are
somewhat annoyed that the C64 seemed to grab all the limelight in the
computing press and amongst software developers.

Just to show how much easier the Atari is to program for, the free
RAM below the operating system on the Atari is readily available
(about 40K) of it. If I remember correctly, the aforementioned
programmer's manual for the C64 said that all the free memory in the
machine had to be ... gasp ... BANK SWITCHED!! Yup, the main memory
on a C64 is split up into 16K blocks.

> excess XL-series machines onto the market, right?

I'm in agreement with this, although it actually seemed to work both ways. In the UK, the original 800 cost about stlg600 for a 16K unit back in 1982. Of course, not very many people bought one (I used to know someone who did fork out that much for one). Then, when the Tramiels took over they redesigned the machines and lowered the price. Initially they were still about stlg20 more expensive than a C64 but gradually the price continued to drop.

Unfortunately the upshot of this price drop was that the Ataris were thought to be crap simply because they were far cheaper than other machines of the time. I got into some horrendous arguments with a BBC Micro owner when we tried to convince others that our machines were the best. As soon as the price was mentioned people immediately regarded the BBC as being far superior, regardless of the specs that were mentioned. The Beeb at the time cost about stlg300 to an XL's stlg130 and was much inferior with only 32K RAM, a crappy little internal speaker and a much smaller palette. The only thing it had in its favour was a very fast Basic, but even that was flawed.

Hey! Don't bad-mouth the C16! It saved my 8-bit's bacon. We bought my sister a C16 to keep her off my Atari. Quite a nice machine actually. Mind you, I ended up buying 90% of the software for it.

Hell, who knows and who cares? The point is that the Atari 8-bit is
still going even if Atari themselves have given up on it. So long as
users continue to give support to the suppliers, I don't see any
reason why it can't thrive well into the next century.

: I agree that the 5200 was a big mistake, that an XEGS-type unit should
: have appeared instead. We can only guess how that might have changed the
: market. Obviously C= never made a game console from their machines until
: the CD^32. Kinda full circle because the Amiga was originally designed
: as a game console.

Actually there was a C64 Game System which came out first. It was
a bigger flop than the XEGS, though. The CDTV also predated the CD^32.

: as was possible, with the C=128 and the AppleIIGS respectively. The Atari
: 130XE is by far the most pitiful of the three in terms of amount of
: meaningful improvements, in fact there were problems (the keyboard,
: ECI+Cart vs. PBI, soldered chips vs. sockets, etc..)

I thought the 130XE wasn't bad, although you're write about
Atari's limited improvements. An 80 column display should have been
included. I think Atari was more interested in getting people to buy STs
instead.

> think...)
>
> Good luck!

I wrote siocopy back in July. I moved and have not had internet access
until now. The LINUX version was adapted from my original code (idea?)
by (someone who's name I have forgotten). I only have a XF551 disk drive.
The program works well on my IBM 486/33 and my IBM 286/12 using this drive.
I do not know enough about the 1050 to implement this drive. I made
several attempts at reading a 1050 formatted disk on my XF551, but I
could not get it to read properly - it is possible, but I do not know
the proper device commands and disk format.

If there is enough interest, I may try to get the 1050 to work. However,
I should point out that a number of people could not get this program
to run at all on their IBM PCs. On the older and/or cheaper IBM PCs clones
the designers have non-standard (whatever that means) implementations of
the parallel port that effects the operation of my program.

True, but that is mostly Tramiel's fault. To introduce a 65816 system or
a faster 6502 or 802 system in 1984 was still a little early. But they
should have been able to enhance Antic/GTIA by then since they did get
someone to design a new custom chip archetecture for the 7800...

: vector points that switched memory banks as needed? It was pretty silly
: that less than half the address space was available for programs by the

: should have been possible to give a user as much as 60K for program space.

The OS and DOS, contrarty to popular opinion, is NOT dead weight. Those
routines are used so often that it isn't usually a waste to have them
there when you are programming. That's why a single poke can do stuff
that would take several lines of code otherwise. It is also possible to
disable the OS and use an interrupt routine to gain full access to 64K.
Not very elegant, but it worked for many games and eurodemos.

: What about the lame disk drives? A lot of people bought Happy just to get
: the improved performance (and then there were the asshole developers who
: deliberately tried to screw people with Happys).

They should have been parallel, yes. But they were better than the C=
drives. They also should have been double density from the get go.
NOONE was using single density anymore, not even in 1979.

: peripherals which only ever were used in one application (the paddles?
: the light pen?)?

I don't see how this is a big issue.

: Atari under Warner decided that they didn't have a computer with the
: 400/800, but rather had a games machine. I approached an Atari bigwig in
: 1981 or 1982 about developing some commercial applications, and was
: rather rudely told not to waste his time, games were the only thing that
: was of interest to them.

They were of split minds on this. It was a curse on the machine to be
treated as a game machine, but it was how it was most popular. Many
people got the 800 when it came out solely because of Star Raiders. When
Jack Tramiel took over, he wanted to try to remove the game machine
stigma, and instead of trying to change the image of the 8-bit, he

created the ST and threw up his hands and accepted the role of game machine for the 8-bit. That's why the majority of Atari produced software in the mid to late 80s is games and only a couple productivity things (Atariwriter+/80), in the end for the XEGS. I see this stigma as pointless because ALL computers are game machines, and its image is always illusory. There were great games for most machines, including those which are seen as the most businesslike and serious such as the clones. By releasing a computer that was relatively CHILDPROOF, impervious to easy short-circuits, from a company that was known mostly for the 2600, it was understandable that people's first impression would be 'game machine'. Not to mention the archetecture itself which was so set up for games. However, this doesn't mean that's ALL it can do.

Case in point. If Atari had decided 'we want a serious computer' and purposefully avoided adding hardware sprites and scrolling capabilities, a program like FlickerTerm, which uses Sprites and custom scrolling routines to support vt100, would be IMPOSSIBLE.

: And such games! Remember ET, easily the worst computer program ever
: written? Atari was largely responsible for the collapse of the entire
: video game market in the mid 80s, by flooding it with shoddy games.

No. I don't buy that at all. Sure, Atari's debaucle with ET and PAC MAN were legendary, and remember, this is 2600 history, not Atari 8-bit. But by 1983, almost everyone who was into videogames HAD a 2600. Hardware sales of the 2600s could not be sustained infinitely. Therefore Atari had to make money on carts, but they were competing with several DOZEN 3rd party manufacturers. So it was like how IBM is now a 2nd stringer fighting clone makers. Atari 2600 carts continued to sell briskly beyond 1983, but the profits were split across all the competing 3rd party companies, and none of these companies benefitted from this.

: Once the ST came out, it was clear that the 8-bitters were dead.

Yes, well, they didn't move to the ST if that is what you are thinking. Some did, but they were the exception, not the rule. Jack alienated his only preexisting userbase by introducing a new machine which was so different from the Atari, and in some ways was a step BACKWARDS (3 vs 4 sound voices, less than 16 shades in the color palette, no hardware sprites, etc..) With Commodore, I believe they offered C64 emulators for the Amiga soon after it was released. How good they are, I don't know. But they did try to ease the transition. Apple did the same thing with the MAC I believe although I don't know how good an Apple II emulator would be on a monochrome display, in some ways the MAC was a step down even from the Apple II. The only 16 bit machine which didn't compromise the graphics and sound capabilities compared to the previous 8-bit counterparts was the Amiga. It took a few years before the graphics and sound eclipsed their ancestors, due no doubt to the final realization that these things DO matter and they do not instantly stigmatize it as a 'game machine'. Yeah, I know, they moved mostly to 640x200 or 640x400 and supported better digitized sound. But like I said, that doesn't tell the whole story on what the gfx and sound can accomplish.

:
: I must have my facts wrong. I could have sworn that the Commodore
: had 3 voices to Atari's 4. So, the C=64 had 5 voices? Sheesh!

It's 3 plus a noise channel I believe.

I don't care that the C= had 320x200 at 16 colors. The multicolored text mode is nice, but in general, the 16 colors it has, which are NOT paletted by the way, are a bunch of washed out pastels and a few good ones. The Apple II is a little better but still, history has shown that paletted is better than fixed.

I was never that impressed by the C= sprites either. I don't think they are as flexible as Atari ones. Multicolor, fine. But what about sprite resolution and horizontal double/quad registers? What about using display list tricks to take a PMG strip and simulate more players with it? Changing horizontal position on the strip halfway down and having 2 images on the strip, there you go, you got an extra PMG to manipulate. What about PMG priorities? Etc..

It should be noted that although some people consider the ST the savior of Tramiel Atari (despite their steady decline until salvation with the Jaguar and the Sega 90 million agreement which is again, quickly eroding), the total number of STs sold PALES and I mean PALES in comparison to the number of Atari 8-bits sold, this despite the fact that the ST has been on the market for nearly 10 years, about as long as the Atari 8-bit was manufactured. That's not necessarily saying that they should have agressively kept on marketing the 8-bit in the late 80s, but that again, it was a MISTAKE for Tramiel to essentially alienate that kind of userbase with the ST. Few people outside of musicians would consider buying an ST. 8-bitters were split on the thing. The only chance Atari had, was to sell a new machine to their 8-bit userbase which had steadily accumulated despite all obstacles, in the previous 6 years, into a fairly healthy number, even in 1984.

: Atari's limited improvements. An 80 column display should have been
: included. I think Atari was more interested in getting people to buy STs
: instead.

There were, of course, many chances they missed with all the vaporware.

Never pushed a 3.5" drive. C= eventually offered one for their 8-bits.

Then the XEP-80 which uses the slow joystick port instead of it being at
least an SIO, cart, or PBI device.

Also never releasing the 1090XL expansion box.

Also removing the PBI from the 65XE and XEGS was a mistake since they
should have seen that ICD had released the MIO and they should continuue
to support it on all models, that and the video jack compromise on the XEGS.

Actually, they are. 64 modes are limited to only a few of the 16 at a
time with fewer bits for color. I agree the color choices are less than
stunning.

>ones. The Apple II is a little better but still, history has shown that
>paletted is better than fixed.

The Apple II's color was far worse in my opinion, because there was no
separate generation of Chroma/Luma. Instead, the Apple shifted the Luma
pulse to get color.

The 64 sprites have fixed priority, and single & double width modes. You
could set an interrupt for a scan line on which to move them so more
could be simulated on the 64 too.

Freddie was a Memory Manager that allowed the CPU to read from 'primary'
RAM while the video DMA happened from 'extended' RAM for the same
physical addresses. This took the display out of your way until you needed
to change it. Of course, you could bank switch as you would with other
RAM upgrades too.

Its it Electronic Arts? All the electronic arts programs look into the
rom at $c000 to see if its not the original atari rom. If its OMNIMON or
any other modified OS it will display 'REMOVE ROM AT $C000' and lock up.

There is no legitimate reason for this except to prevent thier programs
from being cracked.

Sorry Mark, must have missed that post of yours...

I got a used copy of Diamond 3.0 about a year ago; while it's interesting to look at and play with it isn't really a usable environment. From a programming standpoint it's pretty easy to use the Diamond routines, but many of them are of limited usefulness. As well, the v1.0 technical docs are next to worthless - I learned more by trial, error and source code listings than by anything else. Given that it was produced by one person, it's a remarkable achievement, but that still doesn't mean that it's workable.

I also downloaded all the Diamond message bases from GEnie, which provided for an interesting historical overview of the progress of Diamond. It also provided a nice technical supplement to the programmer's notes. If you have any specific questions, please ask and I'll reply as best I can.

Joe: I remember many friends with Apple][s, and can't remember a single legit piece of software in any of their systems. In fact, I'd bet that the widespread pircay made people more likely to buy Apple hardware - they knew they'd be able to get software for their system!

My best programming memory dates back to the week the Atari 800 arrived at home. I spent hours typing in programs from the manual that came with the computer - remember the collapsing boxes? Then, I discovered that I could save the programs to disk, and not have to retype every time - what a timesaver!

Of course, I started to modify the programs. And I came up with a brilliant bit of insight. "Better make sure that the memory is clear before I run the programs" I thought. So, to every program I typed in, I added a new line 0:

```
0 NEW
```

And, sure enough, whenever I ran the programs, the memory would be clear - of everything, including my program.

After a week or so I figured out what was going on. Needless to say, I've learned a bit more since then.

Hey, just got my hands on PC XFormer 3.0. I love it!
Found some bugs already though. First, load up
Doug Engel's game ROCKS (included in Analog
compendium 5.4). Notice that the game runs and
that it is playable. However, the asteroids, which
are implemented as a set of scrolled characters
with display list interruts between each row so
they can scroll independently glitch on the first
scanline or so after the display list interrupt
which define their position. Second, player missile
graphics are used to implement a set of satellites which
zoom across the bottom 1/3 of the screen. Usually,
they only explode if you collide with them. Here, they
explode soon after entering the screen area...

Finally, can I beg you to put in full sound support?
There I did already... Oh please! Oh please!
I want my FULL compatibility!!!!

BTW I am running on a generic local bus 486/DXII-66
PC with a Cirrhus 542x graphics card, and a soundblaster
16 sound card...

Fantastic hack overall!

Scott@4Play who is going to be buying several of these
babies as gifts...

Oh, I don't know about ET being the worst ever written, I think there have been worse. But it is true that Atari gained a bad name for releasing bad games for it's machines. There was a thread in the video.classic groups about which was the worst game ever released on 2600,5200 and 7800. Atari also did a bad thing by just letting any third party developer release games for their machines, not everyone had the same standards. Basicaly Atari picked up a bad name from there.

>Too bad, too. I picked up a 130XE and a couple of 1050s a couple of years

>otherwise I could never get to DOS from BASIC. It used to work).
You're probably not too interested in this, but:
Either your expanded memory has gone bad, you managed to change your RAMDISK.COM file somehow, or you did something to your DOS. To get into DOS from BASIC you need to make sure that the DUP.SYS file is on your ramdisk, and your DOS knows what drive number to load it from (ie. the ramdisk drive number). Further than that it depends what DOS you're using.

>be another Wordperfect version that executes in DOS, even though the
>latest and greatest may not run quickly on your computer, the stuff you
>have now will continue to work. Obselescence does not mean the equipment
>and/or software become useless.

But next year, 486DX/33 computers WILL be $600. And don't forget how much
the Atari 800 cost at its debut.

My point: If, indeed, one can do everything he/she wants to do with a
specific computer, regardless of age/obsolecence, then that's great.

However, things are always a bit easier on newer machines and if you
don't buy the current "greatest" model, you'll be paying very little
for more power (less waiting, less disk-swapping, better output, and
overall, more productivity). Just buy technology a year or so after
it's introduced and you won't be paying a lot but you'll have
something that still has support (should you decide to do anything besides
using Lotus 1-2-3 1.0, for example) and is a marked improvement
over odler technology.

I don't totally disagree with you. I think it's pretty stupid
to go out and spend $2000 on a computer with the latest technology
unless you really need it. But I also think it's counterproductive to
keep using old hardware if it isn't as good as you want it, and you
can get the next step up really cheaply.

You can get an Amiga 1000 with a color RGB monitor for about the same
price as people ask for a 130XE and two XF551 drives: $150-$200. If the
Amiga allows you to be more productive time-wise, EVEN IF the 130XE will
do ALL of the same stuff (but it won't), you should go with the Amiga,
if you were buying a new general-purpose computer
[I'm not suggesting that current 8-bit owners abandon their computers.
Not at all. The point-of-view for this entire argument is that of a person

buying his/her first computer.]

There just isn't any sense in people who don't have a computer and want one today going out and buying a 130XE setup when they can get much more powerful computers for the same price or not much more.

If you'll have a closer look to Germany you notice that until 1985/86 the Atari machines were much more expensive than the C= ones.

Another point you have already mentioned is that also the 130 XE is based on the concept of an 1979 system with only some little changes.

I think, that the original concept isn't made for an Home-Computer but for something as a Personal-Computer: the good structure of the OS (have a look to the C=64 side and you`ll know what I mean, a confuse mix of Basic and OS), the bootable DOS, the PBI-architecture and so on...

And so the C= 64 was much better for the public than the Atari: cheaper, better sounds, a good grafic (with multicolour Sprites) and a lot of good games!!!!

I would have loved to have an Atari 800 but the price was just too high. Commodore 64 was good enough and had similar features. And it CAME with 64K ram... as opposed to a typical 48K.

Atari 400 had a low price barrier but the chicklet keyboard was just plain silly.

Sprite Graphics are DEFINATELY better than Player Missle graphics on the Atari. While amount of colors is nice, it is not necessary and also eats up a lot of RAM... The Commodore 64 was able to get some nice pictures regardless and I think the Commodore 64 had an extra 8 pixels of resolution at high resolution mode.

Also, the Commodore 64 was very friendly frm the point of view of making programs with color and graphics... Having the base 16 colors able to be entered from the keyboard is really nice (cant remember if Atari features the same thing). You could ,ake a color graphics program without even poking anything for color changes really.

And plus, William Shatner was doing Commodore commercials! Oh, im sorry.. those commercials made Commodore stock DROP. heheh

Later,
Gunther

PS THe built in SID chip was nice for the 64 also... As a Home game machine though, I would have dearly loved to have an ATARI with FOUR joystick ports. I loved playing MULE like that.

I loved my Commodores too, but have to disagree on this one--not much
question Atari BASIC was far superior to CBM BASIC 2.0, especially in
regards to access to color and graphics through BASIC commands.

6617. SIO2PC, or sth new?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-25 16:08:09 UTC
From: yhavinga@cs.utwente.nl
Message-ID: <3b5259$rds@utrhcs.cs.utwente.nl>
Source record: 97072

Reading this newsgroup, I have slowly gotten the idea that it
is an unstated rule referring to SIO2PC as being great etc,
though more and more users are getting a bit sick of it, and
start thinking about new sorts of interfaces.

Personally, I have tried SIO2PC, resulting in not using
SIO2PC. It is just not capable of doing fast what I seek in
an interface to a PC : I want to use the harddisk of the PC
to store files. I do not want boundaries of emulated disks (ok
that is no problem anymore) but I also want to have direct
access from the XL to files that I store on the harddisk
at the PC. So the filesystem has to be shared. I do not
want to start several hundred programs each time I wish
to transfer a file to the PC and vice versa.

These are my demands on an interface, and currently I am
working on an interface that will satisfy MY needs.

From the posting of Andrew Heller (PC21050), I conclude that
also he (you?) must have some demands that SIO2PC doesn't
handle. This is a very interesting idea; there might be
more people that have certain wishes about an interface.

Maybe, if heads are sticked together, an interface can be
designed that satisfies the needs of all, instead of one.

If people are with me, I suggest that will be focussed
on features the interface must have, or in other words,
the things people want to use the interface for. If we have
a list we think of to be complete, the hardware/software
requirements can be formulated and designed.

You have a point there on the good structure of the OS of the atari 8-bitter.
I think what we can learn from history is that the C64 has been more a game
machine than the atari; more in the sence of better graphics and sound.

A good OS however doesn't help us much with games; most games use the OS only
for loading, but is comfortable for programmers. The OS of the atari, in
combination of the excellent design of the hardware (I mean the way things
are organizes) has made the XL the perfect machine for making hardware
enhancements and their software equivalents.

So, success of a microcomputer can be expressed in sales figures, or other
criteria. For me, if I must express things in winning or loosing, I must say
the XL has won.

But by the same token, I believe that CBM BASIC had a big advantage in it's
handling of strings and arrays, which Atari BASIC is slightly silly about.
I doubt this would be much of a mitigating factor, though. When I used to
fiddle with the computers in the stores, I'd play with the colors and sound.
On the C64 you could change the text colors just by pressing clearly labelled
keys (as has been mentioned), but sound was nigh impossible without a chart
of necessary POKEs. Atari BASIC gave you much nicer access to those features.

So now that I've run around in a circle here, I'm wondering if maybe the Atari
line didn't do as well because of the association everyone had of the name
Atari with the 2600 VCS? If you don't know much about computers (as my parents
certainly don't) one could easily think that Atari just made game machines,
not serious computers?

Hey, even I, a commodore computer enthousiast, have drooled over the Atari 8 bitters! They had color and sprites before commodore had. And the disk access *was* better integrated in the Basic, you know...

In a previous article, mrc@CAC.Washington.EDU (Mark Crispin) says:

>Atari got its ass kicked by bad management and bad marketing of a sort
>that was not equaled until NeXT.

NeXT is a good case in point. Probably not too many people are aware that the DOOM editor (DOOMed) used by id Software is a proprietary editor that only runs on the NeXT computer (source: PC Magazine Nov 8, 1994 page 316).

id is smart enough to use a machine that they feel can do their product the most good. Ya know what....in that magazine there was no other mention (ad or otherwise, of the NeXT. Atari isn't the only one with marketing problems!

>

Of course. In those days the bottom line had to do with games, so they went for anything that would accomplish that end. Thats why Atari developed very little in the area of utilities. People like Bob Puff became Atari legends with the sheer volume, quality and imagination of the software they produced.

>
>Once the ST came out, it was clear that the 8-bitters were dead.
>

Atari seems to be developing a pattern where the latest and greatest gets everything, while last year's product gets the door. All this advertising for the Jag in magazines, and nothing on the Falcon. Does that mean all the R&D and front money for the Falcon is a write off??? Not only that but the Falcon is being pushed in Europe, but nothing at all his happening in North America.

An Atari dealer here in Ottawa Canada has called Atari via telephone for info on the Falcon , and TT so he can take some orders from prospective customers but Atari will not answer his calls. That's about par for the course for Atari. They had the same pattern when the 8 bit, and ST were dropped. Sort of the "ostrich" method of customer relations.

$.02 price which was directly related to overhead. I had several friends who used to work at Atari & they describe the experience as something like a corrupt circus with everyone gone mad. I remember sometime around '83 a discounted 1200xl was advertised for $249 with basic. When I wnt to the store they told me they meant you could buy basic for an additional $50. Foggy memory, but I think C64's could be had with built in basic for less then $200. Jack Tramiel just had tight control on the ship so with people having to actually be held accountable for their work, things got done cheaper/faster. He also skimmed less of the profits off into his own pockets relative to Gould which is why Atari is still here & Commadore is history.

I would really reccomend everyone work for a start-up firm for a couple of years just to see what happens. You have to realize that the people who bring the company to profitability are the last ones to be taken care of. Jay Minor is a classic example, Mensch <sp?> who came up with the 6502 with Peddle<SP?>. I wish I could remember the name of the engineer that did the ST. Story I heard was he was offered stock instead of decent pay. Once all his stock options had matured, Atari didn't give him any more options or a big enough pay raise to keep him interested in staying.

There's a saying in sports, "You dance with the guy who brought you!" American companies are probably the most notorious in the world for violating this priciple. Atari gave money and control to everybody *but* the ones who made them profitable, Commadore didn't give money to anybody. To me it's as simple as that.

It's a little tough to do if you're working in BASIC. I've been using
a Needham EPROM burner I got for my clone since my Atari one broke. The
Needham one sells for about $120 via mail order & works fine. Cart making
supplies can be bought from B&C ComputerVisions in Santa Clara, CA if
you don't want to take apart an existing cart. Let me know exactly what
you have for a program & I may be able to give you the rest of the info
you need.
Rick

6629. Re: SIO2PC, or sth new?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-25 19:50:02 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3b5f5a$2bf@nic-nac.CSU.net>
Source record: 97081

I think the following would be essential additions to SIO2PC:

1) Ability to jump to MS-DOS (with a command) from the Atari
(ie, say I just downloaded a JPG on the Atari, sent it to
the IBM, and want to convert it to GIF.. I'd like to be
able to run "DJPEG" for the PC without touching the PC)
2) Multitasking- how about the ability for file transfe
stuff to be going on while I do something else either in
SIO2PC (like add another disk image) or even while I'm
not still IN SIO2PC (ie, have it run in the background
while I'm in Telix or shelled to DOS or something)?
3) Direct access of PC files either via another drive
(say, D8: could be it) or via a handler loaded into the
Atari; no more of this "Install PC file" on the IBM, or
"File2PC" on the Atari.
Say I wanted a directory of C:*.* .. I could tell MyDOS
to give me a directory of "D8:C:*.*" !? :) Say
I wanted some file off of my A: drive, I could tell MyDOS
to copy "D8:A:\FILE.EXT,D9:FILE.EXT". A lot of simple
stuff like deleting files, changing directories, etc.
would actually be quite difficult to do (to trick MyDOS
or SpartaDOS or Atari DOS 2.5, at least). But may be
worth it. It seems though that SIO2PC would have to
say "oh, you're looking at the disk directory sector
now" (the "S" command which pops up on SIO2PC's status
line I guess could tell it this). Then it would have to
look at the directory you want, convert it into SpartaDOS
or MyDOS (perhaps an Option for SIO2PC) format, and then
send it back to the Atari?...

Anyways.. A lot more could be added, but I feel these could be
especially helpful. Oh, these and better directory listings in
SIO2PC. :) I often have to H:Shell-to-DOS and do a "DIR" because
the "D" command doesn't give me enough information.

And now to bitch about other things :) PC XFormer's Drive Config.
menu doesn't have any useful commands like:
Disk directory
Shell to DOS or howabout even
Save State for when you wanna exit but not lose ANYTHING? :)
& Load State of course (The "States" could be saved as files
which include what OS you're using, BASIC on/off,
the drives/files you had installed, and ALL Of the
emulated Atari's memory...)

My last complaint: S2PC doesn't recognize at LEAST ONE of my MyDOS
ATR files. I have a 2048k (2MB) disk image which has no files in the
root directory, but has a bunch of SubDirectories. I tell S2PC to change
directory and it says "xxx is not a directory". I tried explicitely
saying "MAZE." and "MAZE . " but those two weren't even recognized by
it for some reason (I was trying to change to the "MAZE" directory). Hmm.
It could be because I'm using MyDOS 4.53 maybe? What MyDOS does S2PC
support? What DOSes does ATARIMG support (too bad I can't run that program
either cuz I have a crappy CPU or I don't have good enoguh graphics!)

>Soooo.... what causes this??? Anybody? Anybody?

As I recall, giving a non-integer value to something that expects an
integer just results in INT(x) being used. So in your example,
location 710 would end up with a value of 10.
Why use the decimals then? Usually when I've seen it it's in a loop,
with the value going through some math expression. No explicit
real-to-integer conversion is done, since all numbers are floating
point and the Basic commands take care of converting everything to
integers. It ends up being a bit like analog-to-digital conversion,
with inputs being precise (to 10 digits) decimal numbers, and outputs
being integers.

>Linux on their PC.

Yup, there are a few of us. I haven't used my 130XE in years (missing keyboard, broken 1050 drive belt, little free time, etc.) since my computing power requirements have grown a bit beyond that (SPICE3 on the 8-bit? :-)). I'd still love to have the time to tinker around on it. The edit/run/debug cycle time seemed to be a lot shorter even for relatively fancy programs, thanks to the graphics and sound features. I wish it could be that easy to develop X programs. :-(

And the games, of course. The graphics don't seem so great anymore, but at least they had the gameplay factor...

Speaking of Linux, didn't someone some time ago mention he was working on an 8-bit emulator for X? I haven't heard anything recently.

Ah! So Freddie is the bank logic controller!

Does that mean that when Antic is looking at banked memory the CPU is no longer interrupted by Antic's DMA instructions? That would make a banked display run a lot faster - and would all of a sudden make the 130xe a much better choice, IMHO.

Dave

I'll tell you all why I bought a C64 instead of an Atari 800xl.

I was an Atari 2600 weenie and wanted nothing more than to buy an 800xl, BUT I had the good fortune of seeing a C64 brochure lying on the grounds of the store that carried the machine I wanted, the 800xl. I had done my homework on the 800xl and so I was blown away when I read what the C64 had to offer. For $250 *LESS* than the 800xl, here was a machine that would do the same things. Sure, each machine had a few strengths over the other, but on the whole they balanced out. (800xl had more colors, which I never saw the games of the time take advantage of, and C64 had the industry-leading sound.) Peripherals too, 1050 blew away the 1541 for speed (heh, anything did), but 1541 had an extra 50K in its disk format (which was a big deal back then). All in all, at the time, the C64 was, IMHO, the "best bang for the buck."

Again, bear in mind that all this was many years ago. I'm sure the 800xl, just like the c64, has been taken to limits no one expected when these machines came out. (eg., drive & video improvements - hardware/software, none of these were available on both machines at first.)

No, I think that since only one device can access RAM at a time, the speed
penalty is still there. A more advanced MMU would have to be built for that.

I'm the ultimate minimalist. I like to do stupid things like write my own PC-based 6502 cross assembler in in 8086 assembly language--and I'm actually proud that the EXE is under 5K. I don't like the silly "gotta have the ultimate machine, gotta upgrade every year" philosophy that runs rampant these days. And after programming PCs, some mini and and mainframe computers, a very expensive telecom switching system, and a couple of currently hot game machines, I still like the Atari 8-bits.

But sometimes, amid ridiculously large and complicated systems and bloated software, there are some things that are amazingly simple and nice that would've been hell on my 800. Like using QEdit on a PC--having 20 files open at once and cutting and pasting and zipping between them. Or using SimpleText or the basic features of Microsoft Word on a Macintosh--highlight a line of text and make it bold and a slightly larger size, piece of cake.

I do think that this sort of thing could be done on an 800, but it would be a serious effort. It's much easier and cheaper to feed off the perfectly good hardware thrown out by PC fanatics. Heck, you can get 386sx machines for _nothing_. There are tens of thousands of businesses and individuals willing to _give_ them away. It's kind of sad, in a way.

(Discussion about who won, Commodore 64 or Atari 800xl.)
Consumers of both won. Producers? Well, maybe Commodore
did a little better, but I think Atari overproduced the
8-bit and didn't make a wad of money. Atari probably made
more on 1050 drives than on the 800xl. Shiraz Shivji was
the engineer who designed the ST. Atari has closed down
most of its R&D and manufacturing facilities, so they now
are basically a designer and then let out contracts for
producing the designs.
As far as C=64 vs. Atari 800xl. I'm glad I got into the
Atari 8-bits. I've probably saved 3.94 years of my life
just doing disk accesses alone. The SID, in my opinion, is
definitely the superior sound chip to the POKEY. But POKEY
is adequate. I say both C=64 and Atari 800xl consumers were
winners because of the large software base for both
machines. Probably the C=64 has a little more software, but
the 800xl has plenty. In my opinion, the 800xl does not
have a decent data base and doesn't have a good 80 column
option. The C=128 did go to a good 80 col display which is
a distinct advantage over the 130xe.
To sum up, I don't think I could have gone wrong with
either the C=64 or the 800xl. Either would have given me
years of enjoyment/education/usefulness. Life isn't long
enough for me to have done both machines. The manufacturers
I don't think did enormously well, considering Commodore is
out of business and Atari is just barely hanging in there
with the Jaguar and Falcon. Both companies lacked something
that might have made better business sense. Indeed both
companies are the children to a great extent of the
Tramiels. And the Tramiels are still hanging in there.
Gould's company is gone for good, I think. But I really
would like to see Panasonic or somebody buy the rights to
Commodore and do something with the Amiga. Probably both
the Amiga and ST are losers from the producer's point of
view. I think the Amiga wins out over the ST in consumer
loyalty and software produced for the machines.

: pictures regardless and I think the Commodore 64 had an extra 8 pixels
: of resolution at high resolution mode.

Nothing is totally fixed with the Atari 8-bit. Just because graphics 8
stock mode is 320x192 doesn't mean you can'd build your own custom mode
which adds as much overscan lines as your monitor can allow for. That's
what Clay Halliwell did with Flickerterm to allow 80x24 character mode plus
status bars and stuff. Yes, it is a manual affair, but it does herald
what the Amiga did later in allowing for programmable resolutions and
overscan preferences. With wide variations in overscan range in
monitors, it makes sense not to limit yourself solely to RF bandwidth. I
know there is also a poke to compress the screen down horizontally. I
don't know if it will let you widen the display beyond 320 pixels, it
might. My monitor wouldn't show the overscan if it did.

: Also, the Commodore 64 was very friendly frm the point of view of making
: programs with color and graphics... Having the base 16 colors able to be

That is not true. The goofy way screen memory is mapped on the C=
combined with the lack of specialized gfx commands from Basic makes
programming graphics nearly impossible for the novice.

Collapsing boxes...hmm...nope, don't remember that. :(I must
have some flaky RAM chips. :)
RE: saving programs to disk....I went through the re-typing everytime
phase, and it was my own fault. I was 13 yrs old (had just turned 13,
in fact). My parents and I were at Macy's, and I told them I'd love to
have an Atari computer for Xmas (my B-day is Nov 27th, so this was coming
up quickly). So, we looked over the computers, software, and peripherals.
I, wanting to sound like I knew what I was doing for one thing, and for
another trying to keep the price down so that I could actually have it
as a present...I suggested the Atari 400 (bleh...membrane keyboard!), and
said I didn't need a 410 (an 810 was out of the question, of course).
oops. :) So, I got just what I asked for. Fortunately for me,
about a month later my parents bought me the 410 and States and Capitals. :)
The original gift I got was the 410 w/BASIC and the Entertainer
package. Had great fun with Star Raiders. Had fun typing in some simple
AD&D-style combat programs. But didn't have fun when I had to retype
them from memory every time I wanted to play. :)

>Of course, I started to modify the programs. And I came up with a brilliant
>bit of insight. "Better make sure that the memory is clear before I run the
>programs" I thought. So, to every program I typed in, I added a new line 0:
>
>0 NEW

Oh, that's classic! At this point, it seems like the most idiotic thing in
the world to do. But, when you're a computer novice, and all the manuals
tell you to make sure you type "new" before each program, well...it's
not hard to understand someone getting confused on that. :) If you don't
yet know how the computer works.....!

Thanks for sharing your story!

-Joe

: - No one I hope!!

Well, there were a plethora of AtariBasic games. A poke is a poke is a poke, you see, and it is still easier to do intermediate gfx work within an interpreter than to move to assembly or C. It isn't that hard to get ML speed by poking the right OS locations, etc.. I have a book on how to use string manipulation for speed with PMGs. Yes, there IS a lot you can do within Basic.

That's why mourning over the missing 16K RAM in the 800 is a little shallow, since the OS is chock full of powerful poke locations that will keep your code smaller and easier to write than if you had a more spartan OS and more RAM to play in.

6645. New Standard

When I referred to a standard for 24-pin printers, I meant that software which involves graphics should support 24-pin DM printers.

If you take Print Shop & print out a graphic with it using an Epson LQ-500 series printer, the graphic will be longitudinally distorted (aspect ratio distortion). And it will still only have 9-pin resolution.

There was a place in Michigan (the name escapes me) that brought out a 24-pin drivers for a few of the more popular graphics packages. I reviewed one of them a few years back in Current Notes, it was for Print Shop. That driver really only corrected the aspect ratio problem (which was due to a change in Epson firmware when Epson hardware switched to 24-pin resolution). I was really bummed out to see the same blocky 9-pin graphics being cranked out by my nice hi-rez 24-pin printer. I mean if you've shelled out the bucks for 24-pin resolution, let's use ALL 24 of those pins! Not just for text, but for graphics too. Seems it should be possible to write a driver that not only corrects for aspect ratio but will also include some sort of filling/smoothing routine that will fill in the craggies using the other 15 pins.

: I think what we can learn from history is that the C64 has been more a game
: machine than the atari; more in the sence of better graphics and sound.

The reason the C= has a larger catalog including more recent games, is
the 5 year (I think) contract that 3rd parties had to sign to develop for
the C=. This shackled them into making games for the C= 8-bits beyond
the point where they would have seen it as profitable.

However, I will fight tooth and nail the assertion that the C= makes a
better game machine. I have not played a TON of C= games, but those that
I have, I was not THAT impressed with. The animation especially seemed a
little 'off' in a hard to describe way. It must have something to do
with the way graphics are blitted and the way sprites operate that is not
as conducive to smooth animation as the Atari. And the colors, YUCK.
Pink running into light yellow running into white. 320 horizontal pixels
means little when you've got similar colors bleeding into eachother in
the middle of the color clocks, even with split video.

Due to the fact that the RAMBO style upgrades for the 800XL became so popular, very few software was written to use ANTIC banking. Antic banking is a simple form of Video RAM system. Yes, the custom chips and the CPU are both sharing the same memory bus, so it's not like you can accellerate the CPU and the chips the way the AMiga does with chip and fastram, but you DO gain a TON of memory for both graphics and mainline code. Here is how it works (I think)

ANTIC
---
sees banked ram only, in 16K chunks at a time

CPU sees main ram

As you can see, if you set it up right, you no longer lose 8K+ of screen memory in the main address range. Yes, to access the lowest 16K you have to install an interrupt routine to share it with the OS, but still, you pretty much get to the point of being able to have nearly all 64K active for a main program, and you can have ANTIC look to any amount of banked ram for video.

The early versions of Pab Sungenis' QWK reader used Antic banking but he eventually compressed his code to use the standard banking routines (which winds up taking away more main memory than Antic banking).

There you've hit a GOOD point. In my opinion, one of the Atari 8
bit's greatest strength was it's flexibility in the graphics department.
While it was tedious to manipulate all those display lists, with a little
patience, the Atari could be programmed to keep up with the times.
Considering that the GTIA chip came out in 1981, it has held up well all
these years. Look at Jeff Potter's Colorview program! Those graphics are
impressive ... my friends thought they were looking at an Atari ST or an
Amiga, not an 8-bit.

This is a rather large file (31,692 bytes, 1074 lines), so if you don't like large files, and/or auctions, please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update after I'm sure the new one is accessible. I will also e-mail the list to all bidders, and anyone who requests to be placed on the auction e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON MONDAY, DECEMBER 5TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX ITEMS!)

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #8)

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER, DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH.

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

VECTREX:

GAMES WITH BOX AND MANUAL:
$20.00* SPIKE (NO OVERLAY)

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

FOOTBALL (Tele-Games)
GOLF (Tele-Games)
PONG SPORTS (Tele-Games)
TANK-PLUS (Tele-Games)
TARGET FUN (Tele-Games)

THIS IS A COMPLETE 2600 SYSTEM, EXCEPT FOR RF SWITCHBOX AND POWER SUPPLY.

THE BOX AND MANUAL AREN'T IN GOOD SHAPE, BUT BOTH ARE INTACT.

MINIMUM OPENING BID OF $60.00

*****

LOT #5

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND TWO (2)
GAMES [NO BOXES OR MANUALS FOR GAMES]:

DEFENDER
POLE POSITION

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THE POWER SUPPLY WORKS, BUT AFTER TESTING IT I DISCOVERED THAT THERE ARE EXPOSED WIRES AT ONE POINT ON THE CORD. I WOULD SUGGEST NOT USING IT, AND I ONLY SUPPLY IT SO THAT YOU KNOW WHAT ONE LOOKS LIKE, AND CAN READ THE SPECIFICATIONS FROM THE POWER SUPPLY ITSELF.

MINIMUM OPENING BID OF $32.00

*****

LOT #6

ATARI 5200 (4-PORT), ORIGINAL POWER SUPPLY, ONE ATARI CONTROLLER, AND TWO (2) GAMES [NO BOXES OR MANUALS FOR GAMES]:

POLE POSITION
SUPER BREAKOUT

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

MINIMUM OPENING BID OF $35.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

SUPER BREAKOUT (Atari)
YARS' REVENGE (Atari)

BID #1) MINIMUM OPENING BID OF $42.00
BID #2) MINIMUM OPENING BID OF $42.00

*****

LOT #13

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER WITH BOX, USER'S MANUAL (200 pgs.), POWER SUPPLY, 1541 DISK DRIVE (PUSH IN MODEL) WITH POWER CORD, SERIAL CABLE, TEN 10 DS DISKS (WHICH MAY OR MAY NOT HAVE GAMES ON THEM -- DEPENDING ON WHO IS ASKING, IF YOU KNOW WHAT I MEAN), KICKMAN CARTRIDGE, MUSIC COMPOSER CARTRIDGE, AND RCA CABLE.

THIS IS A COMPLETE COMMODORE 64 COMPUTER SYSTEM, EXCEPT FOR RF SWITCHBOX.

MINIMUM OPENING BID OF $75.00

*****

LOT #14

NEW RF SWITCHBOX PURCHASE OPTION

SUPER VIDEO ARCADE (SEAR INTELLIVISION SYSTEM), WITH TWO (2) DETACHABLE CONTROLLERS, AND RCA CABLE. SYSTEM ALSO COMES WITH FOUR (4) GAMES [ACCESSORIES FOR GAMES AS FOLLOWS]:

BURGERTIME (WITH 2 OVERLAYS)
LAS VEGAS POKER & BLACKJACK (COMPLETE: BOX, MANUAL, AND 2 OVERLAYS)
NFL FOOTBALL (WITH MANUAL, 1 PLAYBOOK, AND 2 OVERLAYS)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)

POWER SUPPLY IS BUILT IN.

MINIMUM OPENING BID OF $40.00

*****

LOT #15

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION SYSTEM WITH TWO (2) BUILT IN CONTROLLERS, AND RCA CABLE.
SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTROSMASH
BURGERTIME
LAS VEGAS POKER & BLACKJACK
LOCK 'N' CHASE
NFL FOOTBALL
SNAFU
SPACE BATTLE

POWER SUPPLY IS BUILT IN.

MINIMUM OPENING BID OF $37.50

*****

LOT #16 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION II SYSTEM WITH TWO (2) DETACHABLE CONTROLLERS, RCA CABLE, AND
ORIGINAL POWER SUPPLY. SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, OR
MANUALS FOR GAMES]:

LAS VEGAS POKER & BLACKJACK
NIGHT STALKER
SNAFU
SPACE ARMADA
SPACE HAWK
STAR STRIKE
TRIPLE ACTION

BID #1) MINIMUM OPENING BID OF $60.00
BID #2) MINIMUM OPENING BID OF $60.00

*****

LOT #17

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE, WITH ORIGINAL BOX, AND
THREE (3) GAMES [ACCESSORIES FOR GAMES AS FOLLOWS]:

B-17 BOMBER (WITH BOX)
BOMB SQUAD (COMPLETE: BOX, MANUAL, AND 2 OVERLAYS)
SPACE SPARTANS (WITH BOX, MANUAL, AND 1 OVERLAY)

MINIMUM OPENING BID OF $30.00

*****

LOT #18

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE, WITH TWO (2) GAMES [NO
BOXES, OR MANUALS FOR GAMES]:

BOMB SQUAD
SPACE SPARTANS

MINIMUM OPENING BID OF $20.00

*****

LOT #19 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ODYSSEY2 SYSTEM WITH ORIGINAL POWER SUPPLY, AND NINE (9) CARTRIDGES [NO BOX OR MANUAL FOR GAMES]:

SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!
ALIEN INVADERS -- PLUS!
BASEBALL!
BOWLING! / BASKETBALL!
FOOTBALL!
K.C. MUNCHKIN!
PICK AXE PETE!
POCKET BILLIARDS!
UFO!

BID #1) MINIMUM OPENING BID OF $45.00

6656. Re: Why did Commodore beat Atari in the 8-bit market?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-26 15:22:07 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1994Nov26.152207.18961@cs.nott.ac.uk>
Source record: 97026

In article <3b3gac$ppd@nermal.cs.uoguelph.ca> mrathwel@uoguelph.ca (Mark Rathwell) writes:
>: With 16-bit sound you only have 2 channels on the Atari.
>
>Isn't it three? 2 16-bit + 8 bit?
No. But you can choose between 2, 3 or 4 channels as follows:
POKEY has four 8-bit sound channels (labeled 0 to 3). You have the option of
linking two 8-bit channels together to form one 16-bit channel, (0 and 1 link
together and 2 and 3 link together). That gives you the following:

configurations # of channels
4 8-bit channels. ---------------(4)
1 16-bit and 2 8-bit channels---(3)
2 16-bit channels. --------------(2)

Of course you can switch the configuration around at any time you want, so for
one part of a tune you may have the four 8-bit channels and at another the
two 16-bit channels, or whatever. With some careful planning you can get some
amazing results. POKEY also has volume only sound which allows you to control
the speaker position directly, this is 4-bit giving you 16 diferent speaker
positions to play with, that's how digitized sequences are played.

6658. Superdos

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-26 16:17:01 UTC
From: Masstorage@closer.brisnet.org.au
Message-ID: <303_9411250426@softtech.brisnet.org.au>
Source record: 97024

My name is James Bradford. I am the vendor/developer of the super products. I have taken it over from the original owner. One product 'SuperDOS' was written by someone else for super products. I have finally gotten the source code to this excellent dos. Any suggestions, comments, bugs you would like to see, email me and i will see what i can do. I would like add INDUS GT high speed code to it and while i am at it, fix or add some more features.

What can this dos do??? It can use the high speed sio of happy, USdoubler, SuperMAX, and other USdoubler compatible upgrades and the XF551. The full 360k of the XF551 is used. It is compatible with DOS 2.5. SuperDOS can use ramdisks upto 320k xe or 256k axlon compatible ramdisk. DUP is loaded at boot up and hidden under the os roms (800xl, 130xe, 1200xl) or in bank one of the extra memory. Dup has 1 key commands. Can undelete files. Copy to whole disk to ram disk and back out again. AUX sys file contains seldom used commands. Aux can control such things as the xl/xe key rate, the number of drive/file buffers, copy from dos 3 and write a bootable file loader to disk that does not take any sectors away from the file space. Some dos 2 addresses remain unchanged.

Current version is 5.1.

Any comments, mail to Masstorage@closer.brisnet.org.au .

I remember SuperDOS. I registered my copy many years ago. However, after I moved to SpartaDOS, I placed it in the box with all MyDOS, DOS3, DOS4, DOSXL and a few others that I picked up along the way.

About the only thing that I would like to see would be a DOS that can actually read SpartaDOS's structure.

I have kept all of my old computers, including several TI-99/4As, and Apple II+, Laser 128, 800xl, 600xl, and recently picked up 2 1200xls and an 800. I also have a 486 that I use for 90% of my computing. But the old stuff still intrigues me. Just this past week, I used my 800xl to log into the Internet at 9600 bps in 80col mode, downloaded a few files from the UK, just to show a few of our ST users that "it can be done". Granted, using MOSAIC is a bit easier on the eyes, but still it can be done if necessary.

If I had never hacked the power supply in my TIs and Ataris, never handwired memory upgrades into them, never hacked dual disk drives into a TI p-box, or used a sector editor to fix blown directories on a disk, then I probably wouldn't be willing to open up a PC, change motherboards, add memory and new hard drives, and pick around in a Windows INI file. As it is, I used the machines for learning, and that alone was probably a lot cheaper than if I had gone to school and paid tuition. Plus I still have my machines!

I won't be teary-eyed when my old computers finally stop booting up, I'll just go down to the thrift and buy another one for $10 and take up where I left off.

In a previous article, Masstorage@closer.brisnet.org.au (Masstorage) says:

>bugs you would like to see, email me and i will see what i can do. I would
>like add INDUS GT high speed code to it and while i am at it, fix or add
>some more features.
>

High speed code for the Indus would be great. Thus far, the only thing I have been able to find is DOS XL, which uses the Indus "Synchromesh" speed gooser. Dos XL is good, but I don't like the idea of constantly having to have the master diskette around to pick up overlays.

A command line interface would be nice to have. In other words, you have the option of using a menu, or typing in the command yourself.

Another feature is a file viewer with scroll up/down begin/end of file goto capability. Sure any type of dos can already copy to E:, but its nice to be able to scroll around a document and have the option of going to the end/beginning in one keystroke.

Anyway, just a couple of suggestions, since you asked! BTW, I'd like a registered version of Superdos when you get your next version going, please post it in this base or "announcements" and I'll be first in line with my registration fee :) !!

Regards,

Vince

6665. Atari 8-bit still useable?

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-26 19:26:15 UTC
From: coonj@osuunx.ucc.okstate.edu
Message-ID: <Czw3Bt.LBz@osuunx.ucc.okstate.edu>
Source record: 97028

After reading the article on the Atari 8-bit, it touched my heart. I remember the days of my 8-bit, sitting there with my grandmother, her teaching me how to program and make my name bounce around the screen. I remember writing letters with the "Desktop Publisher" to all my friends who lived out of state. I remember the hours upon hours I spent playing M.U.L.E. and the Cosmic Balance, and Wizard's Crown, my first computer RPG.

And then I thought. "I miss that." So I took a pilgramage to the garage to dig up the Atari 800. I began to go through some software. I used Bobterm and my old Atari 300 baud modem to call (or try to call) one of my favorate bulletin boards. They wouldn't accept such a slow speed, so I connected teh 2400 baud. I waded around the messages for a while and soon got board.

So I began to play games. I played on that Atari 800 for hours, just like I was 12 again. I played all my old arcade favorates, including a sparkling game of Pac-Man, where I actually beat my all time high score, even though I haven't played Pac-Man in years. (I guess it's like riding a bike.)

And then I began to get board. I fiddled a little more, and probably went through half my old software, just trying it out. And I realized "Gosh this is primitive."

To all you 8-bit users out there, I respect your dedication to such a machine, but the simple fact remains: In today's world, the 8-bit is just not powerful enough to handle what is needed.

Sure, the Print Shop prints out the cute little Christmas cards and Flyers for the weekend car wash, and you don't need anything fancy to write letters, or even reports for that matter.

But the Atari 800 can not begin to compare to the sheer amounts of sparkle that today's clones can handle. You're thinking "But all that glitter isn't necessary."

True. We could save lots of money by doing away with air conditioning and using fans. Or banning light bulbs, vowing never to buy one again because you're partial to candles. Candles get the job done. Why waste money on a light bulb, and the lamp to use it with, and the fixtures to plug it into, and the electricity to use it? A candle illuminates still the same, doesn't it?

Yes, I love my old 8-bit. And I have left it set up in my house now so that I can use it for those odd days when I'm in the mood for a good rousing game of M.U.L.E., but when I need something typed, why go back

to it? Why not buy an IBM to suit my needs? I already have. You don't have to spend $2000 on an IBM 486 DX/2 with 8 Meg RAM and a 17 inch SVGA monitor.

For under 800 dollars, you can purchase a 386 SX 33mhz machine with VGA graphics that will run most of todays software fast enough.

Why live in the dark ages and refuse to use light bulbs because you've used candles all your life and don't see why anyone needs to change. If we all had that mentality, I think we'd all be dead of polio by now.

I think you are making a big generalization here. Not everyone who reads this group believes the 8-bit is the ultimate piece of hardware. Many of us also use other computers for the things the 8-bit isn't very good at.

I am also an OS/2 user/programmer becuase yes, the computer world does move forward, but would you approach a classic car buff and tell him his car is worthless because it has no air conditioning, fuel injection, power options, etc..? Sometimes it's nice just to enjoy a hobby in a controlled environment. The Atari 8-bit is hardware that is accessable, well documented, and not in danger of becoming any more devalued by external forces. Just as someone might sit down at a table for hours with an old-fashoned jig-saw puzzle, the 8-bit offers hobbyists a way to truly understand and control thier hardware. I use a PC, but I don't pretend to control or really understand how everything works, and that's the point of the modern computer, to isolate the user from the hardware , and make him/her interact with a high level metaphor , which may help you get more done, but doesn't satisfy those who want to really master the machine.

The home mechanic may understand every part of his classic 'relic', but the modern car he drives to work goes right over his head with its computerized driveline and all.

The sensible 8-bitter doesn't try to take on the world, just defend his love for an old design, a lost way of thinking, which was probably what attracted him to computers in the first place.

Mike Gordillo (621126@mercury.utb.edu) wrote:
: Hello,

: I just want to remind the membership here that neither the ol' CBM
: nor the Atari machines stood still since their introductions. When
: people quote the baseline stock figures it's because that is what the
: companies put out irrespective of future improvements. Both systems were
: improved upon ad infinitum by their users, and are still being hacked to
: death today.

But not in quite the same way as modern PCs. I know there is
SOME kind of 10mhz 6502 upgrade for the C=, don't know how well it works,
but as far as the Atari 8-bit, it was not designed for ease of
accelleration. The newer 16-bit machines freed themselves of this
limitation to a much greater extent. Obviously, it is CPU replacement
that is the most dramatic upgrade you can do. I will be curious to see
what FTE comes up with and HOW they manage to do it with the given locked
1.79mhz system, but even then, old software may break with a hack like
that. Newer software on newer systems is much more compatible when it
comes to running on different CPUs with different clock speeds.

Olaf> you know...

Well, I think BASIC should be forgotten in the comparison, as it is most probably too slow on the Atari too, even if it wasn't programmed by Microsoft.

But what about the disk performance? What kind of disk drives do the 8-bit Ataris use? Were they intelligent (with an own processor), and how fast can you read the disk? For comparison: If using custom routines, you can read a normal 1541 disk track in 3 disk revolutions. (A custom formatted track can be read in 2 revolutions, and using a parallel cable, you can read a track in one revolution.) But I believe that the Commodore holds the records of slowest standard disk routines.

You completely missed the point. POKE was just an _example_. And
furthermore, I've found long decimals in places where I DIDN'T ORIGINALLY
PUT THEM. That was the whole point of my post. Something is causing
integers in old Basic programs to devolve, and I want to know what it is!

> Jeff

Jeff, I'm an IBM platform computer programmer, I use C, Clipper, dBase IV and Foxpro. I use a Compaq Prosignia 486DX2/66 server with 16 meg memory and 4 gig hard drives. It is not used as a server, but a DOS/Windows workstation. Believe me, it gets the hell kicked out of it in terms of use.

At home I have a clone, and also an Atari 800, 800XL and 130 XE. l play Doom, Duke Nukem etc.. on the clone, as well as run database, spreadsheets, desktop publishers, etc... The Atari machines are used for games and certain utilities.

Using the Atari is fun, but you are correct, some of the games for your 800 are primitive. The new stuff for the 130 XE is pretty good though. Draconus and Armarote rival Nintendo games. Even now Germany is cranking out some very impressive software.

However this software is no way as intricate as Doom for the IBM. However there are some very talented developers out there and you can be sure that they will continue to stretch the boundries of the 8 bit.

Regards,

Vince

The Atari drives were intelligent serial devices. With a Happy upgrade,
the Atari could read a track in one revolution, but I believe a stock
drive can do it in 5-6 (anyone know the sector skew exactly?).

2 big problems with the 1541: No external ID switch. Changing the the
ID from 8 to 9 was a MAJOR pain. Also, why did C= put that HUGE
transformer right behind the mechanism? Does't that go against the
"don't put your disks on the power supply" rule?

Also, why did the 1541 get so hot? A disk left in there half an hour
was almost melted.

Atari Basic doesn't need garbage collection. Commodore Basic assigns
memory to string vraibles dynamically, whereas Atari Basic requires a DIM
to set the maximum length of each string. Commodore Basic uses DIM to
create string arrays; Atari Basic doesn't have those, but a string can be
as big as the available memory.

This message,and the one it is replying to, (as well as others who
wrote with similar themes) capture the truth of the idea I introduced:
1) You don't need a $2000 computer to do what you need done. A cheap,
"old" computer (whether a 386SX-16, a Mac Classic, or an Atari 8-bit)
will do the job just as well. Essentially, "if it does the job,
there's no reason to upgrade".
2) The pleasure is the thing. If you enjoy your computer, it doesn't
matter what type it is. There is equal honor in loving to use any
type of computer. (Yep, even Commies[G])

These can be boiled down further into: Don't upgrade just because the
new stuff is out and you feel left behind.

I'm glad we all explored the idea together. I certainly learned a lot,
and even enjoyed doing it. :)

-Joe

Actually, my dad might have told you about this, but there is a game that
is almost like DOOM for th XE. It's called Maze of Agdagon and you can
have up to 8 players all on seperate computers playing at once. All you do
is wander around in a maze trying to find all of the other players and
then blow them away with your armory of bombs...but it's fun.

=CB=

BTW: Maze of Agdagon is by Dataque...I think it's a new company.

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

Hello... just curious.. do you guys still use XL's and XE's because you dont want to invest in a new computer or for sentimental reasons... or perhaps you like the machine better..?? I'm just curious... I still use my C64 because of the Brilliant programming done in the 80's.. I once had an 800XL, great computer.. I had "The Pawn" for it.. best graphics I ever saw on an XL screen. You guys have fun... those are great little machines.

Glenn M. Saunders (krishna@max.tiac.net) replied:

But not in quite the same way as modern PCs. I know there is
SOME kind of 10mhz 6502 upgrade for the C=, don't know how well it works,
but as far as the Atari 8-bit, it was not designed for ease of
accelleration. The newer 16-bit machines freed themselves of this
limitation to a much greater extent. Obviously, it is CPU replacement
that is the most dramatic upgrade you can do. I will be curious to see
what FTE comes up with and HOW they manne to do it with the given locked
1.79mhz system, but even then, old software may break with a hack like
that. Newer software on newer systems is much more compatible when it
comes to running on different CPUs with different clock speeds.

I wasn't trying to make a comparison between 8-bits and "modern PCs"(whatever
that means... :). If we're talking about x86 machines, you'd be surprised
how much of the past they hold on to. For example, a few simple 8080
(circa 1975) routines will translate to x86 (Pentium, et al.) with no
effort. Remember dBase II (not III, but II) ? It ran on both CP/M and
MSDOS. When a bug was discovered in the MSDOS version, the folks at
Ashton-Tate would fix it on the CP/M 8080/Z80 side and shove it through
a simple code translator to generate the 8086/8088 version. :)

Neat, hunh?

Mike

-Bry

Yeah, the lack of a drive ID switch was an oversight, IMHO. Fortunately,
the hardware fix is/was easy.

The original 1541 was hot. I think the power supply was integrated into
the drive unit, and the technology of the day didn't include inexpensive
low-heat supplies (I think :). ?? ^^^^^^^^^^

I did know of people losing disks to the heat, but these were usually cases
where the person ran the drive with books, junk, etc. covering the vents
over a period of several hours. For example, a BBS sysop, who would stack
something on the drive and leave it running all day. By the end of the
day, the disk would probably show warping, especially if it was a cheapie
diskette.

In fact, there was one BBS that renamed itself "Crash & Burn" after suffering
a partial 1541 melt-down :).

Mike

PS: Needless to say, most 1541 owners bought a fan for it :).

6684. MASSIVE AUCTION V -- update #1 (lots of Atari stuff)

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-27 13:14:59 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3ba0oj$nmg@usenet.INS.CWRU.Edu>
Source record: 97054

UPDATE #1:

MASSIVE AUCTION V -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COLECO ADAM
COLECO 2600 ADAPTER COMMODORE 64 INTELLIVISION INTELLIVOICE
ODYSSEY2 PONG (2 types) SEGA MASTER SYSTEM TOMY TUTOR
TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

This is a rather large file (31,703 bytes, 1076 lines), so if you don't like large files, and/or auctions, please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update after I'm sure the new one is accessible. I will also e-mail the list to all bidders, and anyone who requests to be placed on the auction e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON MONDAY, DECEMBER 5TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX ITEMS!)

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #8)

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER, DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH.

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

Just think back to the original atari game systems... EVERY single day you'd see like 3 - 9 atari commercials... the graphics weren't great, but advertising SELLS! Atari never advertised... I also feel analog/antic are in part to blame, but not because of their bad reveiws... what they said was usually true, it was their sudden disappearance... I used to wait at the door for my monthly magazine... I still dont think there is a mag on the market that can ever compete with either of the above 2 magazines... they had reviews, demos, tips, tutorials, and LOTS of type in programs... It's too bad atari can't manage it's own company... I think it had a wonderful edge on other machines in it's class... The PM graphics were not all that bad if you knew the tricks of assembly to create more players than actually existed etc... the languages on it were GREAT... like TURBO BASIC, ACTION, MAC/65, etc... n e ways... that's my 2 cents worth.

SIO2PC is a good little program, it wasn't designed to do everything you
want it to do. It is free, why complain. Most programs are posted with
source code so that others can adapt them to their personal needs.

Go for it!

Mike

>Hello... just curious.. do you guys still use XL's and XE's because you
>dont want to invest in a new computer or for sentimental reasons... or
>perhaps you like the machine better..?? I'm just curious... I still use

I still use the the Atari 8-bit computers for a few reasons:
1) Sentimentality
2) Love the games
3) I like to buy lots of stuff for my computers, and it is a lot cheaper
to do so for this one. :)
4) I love programming this machine.
5) For some things, in some ways...it *is* a better machine. We've
argued this to death, so I won't say more on that. :)

Heck, I have a 486DX2/50, a 386-40, a 286-20, a 386SX-20 laptop,
and 19 Atari computers of varius types. I use them all (well, it is
hard to score time on the 486, since my girlfriend has pretty much
taken it over, and the 286 is the BBS machine). But, I use the
8-bit the most. I use it to play games. I use it to call in (using
Flickerterm...a great program!). I use it for applications (wp,
database,spreadsheet). And, I program on it (tho I also program
on the 386, as I am a BBS 'online game' author).
Oops. "use them all", above doesn't mean I have all 19
Atari's set up! Yeesh. I only have one Atari set up. that's
enough! :) the rest are owned because I collect 'em. :)

I haven't even used Atari's continuously for all these years.
After Atari dropped the 1200XL a week after I purchased it (and had
previously dropped the 5200 after I purchased IT), I swore off
Atari and got an Apple //c (well, there were some intervening years...
about two or three, as I recall, where I used the 1200XL...I just had
a paper route, so couldn't just go out and buy a computer every
month!). I stayed away from Atari until I opened my BBS sometime in
1990, when a user who HAD stuck with Atari all that time (and who
also uses Mac computers) started talking with me about it, and I
got the 'bug'. Been using Atari's ever since. Thanks, David Tipton,
for giving me back to joy of Atari.

Atari 8-Bit Stuff for sale:

(NOTE: The prices below are for individual items,

See SUPER PACKAGE DEAL at the end of this ad.)

HARDWARE:

Reset Button: Plugs into cartridge slot, $10.

SOFTWARE:

* Pilot Programming Language

w/"Turtle" graphics, (Educators'

package), $10.

* Sublogic FLIGHT SIMULATOR 2 plus JAPAN SCENERY Disk, $25.

* Timewise (Time management), $9.

* "Kingdom" (Instructions and

game, cassette), $3.

* "Biorhythms", (Instructions and

game, cassette), $3.

* "Super-Text" word processor

(disk), $4.

* "Atariwriter" (Cartridge), 2 avail., $20. each.

Excellent word processor for Atari

* "The Newsroom" (Compose and print newsletters) $10.

* "Movie Maker" (Animation Construction Set) $10.

* "Your Personal Net Worth", $10.

* "Softporn Adventure", $5.

** The following from XLEnt Software, $15 each, or all 5 for $65.:

(A full desktop publishing sytem for the 8-bit Atari)

a)Megafont II

b)The First XLEnt Word Processor

c)Rubber Stamp

d)Typesetter

e)Page Designer

* Atari BASIC version "C" cartridge. Eliminates bugs in built-in version "B".

BOOKS ($3.95 each plus shipping)

Atari Programming (with 35 Programs)

An Atari in the Classroom

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY

SHIPPING ON ALL ORDERS OVER $35.

All these prices are negotiable. I am especially receptive to package

offers that move a lot of items!

****SPECIAL BARGAIN OFFER****: The items above total more than $200.

IF YOU TAKE EVERYTHING---$89. postpaid.

Please reply by e-mail.

Yep, although the new Archon Ultra for the PC is pretty neat for an
upgrade.

> Computers for a hobby: sure, the 8-bit is great for some people, most

Again, maybe both are great for some people. There is no rule that you
have to choose one platform.

> Computers for use: I don't think the 8-bit covers too much ground
>here, other than the recipe file your wife needs.

Sometimes it's the limitations that makes the 8-bit more fun. People
do as much or as little as they feel comfortable with. This isn't
computing for speed or profit, but for fun.

> I totally agree with all you 8-bit fans about comfortability with your
>8-bit. That's why I still have mine. But I am approaching the
>usefullness aspect of the 8-bit, not the familiararity.

Well, if technology serves us at all, each new generation of computers
with have more it can do. But each new generation of software holds the
same promise, and sometimes we find new things the 8bit could do all
along, had we known how to write the software. Making essentially '79
hardware do things modern computers are doing is truly an accomplishment.

Ya know what's funny, I used ST computers from '86 to '93 and I don't have any around anymore. When the ST market died, the XL was a more attractive "dead" platform than the ST (not really dead as long as people are willing to plug 'em in!). I guess the 8-bit was my first computer so it has a special familiarity to me. Also, the ST just isn't as configurable. I swear, every feature of the 8-bit comes with 50 extra options. :)

: Ahh! Good old address 53768! I used it for "music" like that ones too. :)

How bout someone explaining how the hell that minisong works?

I've never seen the sound capabilities of this machine properly documented, anywhere! The best I have is a funny description of audctl (53768), with something like, "hi-pass filter in Channel 1" and "clock Ch 1 w/ 1.79 Mhz not 64 Mhz" and "17-bit poly changes into 9-bit poly".. If anyone can point me to some nice resource I'd like it (post here).

And, how the *hell* are the demo tunes written? I'm sure there's a program that lays out a VBI automatically, using user-supplied songs (the demos themselves rave about these sometimes), but I've never seen such a utility anywhere!

PMs, DLIs, VBIs, etc so well-documented everywhere, and sound is such a bashful little creature. Like, it's taboo. Shh.

Message-ID: <3bb047$e5i@newsbf01.news.aol.com>
Source record: 96919

*Sigh****

That's right...after all of these years, it time for us to depart.
The evil speed beasts have won my heart over and the old Atari is becoming

a (I hate to say it)...a burden

I have a varied collection of hardware/software that I would like to
sell....

The primary components of which include:
A 256k 800XL running as a 160k machine (sound odd? I can provide details)
A 128k GUMBY 130XE (upgrade looks and runs like an OEM would)
A XF551 FD (like new condition)
An 810 FD (and it works fine!)
An 850 Interface (like new and runs great)
A 1050 drive that needs work (I know what components are needed and where
to get them)
Assorted software...primarily games and PD language compilers, etc

I would like to sell it all as a unit...(unlikely)
But I am flexible in this area as well as the price categories

I am not looking to make money off these things...I have enjoyed them too
much
over the years, and I know how all of you enjoy your machines.
In fact I am considering minimum bids at the cost of shipping...(that
should sweeten things up a little)

Note: Software will not be broken up...since most of it is not (*hmph*)
well...lets say in it original packaging.

Whoever buys the big components of the system first will receive ALL
floppies that I have/can find.

Bids will be taken until the end of the 1st week of Dec

My new email address is:

I was ploughing through the 400/800 Os and Hardware Tech Ref notes last night, and I was once again amazed at the stuff they packed in there, and the possibilities they left open. While the machines don't have proper "slots", they're anything but a closed system.

Another amazing document is "De Re Atari". The game design philosophy Chris Crawford writes about in there is as applicable today as it was then, regardless of the platform. If anyone wants a good discussin of how a computer should interface with a user, this book is a must, IMHO.

: I wasn't trying to make a comparison between 8-bits and "modern PCs"(whatever
: that means... :). If we're talking about x86 machines, you'd be surprised
: how much of the past they hold on to. For example, a few simple 8080
: (circa 1975) routines will translate to x86 (Pentium, et al.) with no
: effort. Remember dBase II (not III, but II) ? It ran on both CP/M and
: MSDOS. When a bug was discovered in the MSDOS version, the folks at
: Ashton-Tate would fix it on the CP/M 8080/Z80 side and shove it through
: a simple code translator to generate the 8086/8088 version. :)

What I'm saying is that one has to put things in their proper
perspective. Had the Atari been designed with a dual bus archetecture
(chipram and main ram) then by now we'd all be running on 10mhz 65816s.

It's all well and good to feel good about Black Boxes and the like, but
16-bit CPU upgrades and accelleration are far more impressive, although
certainly an Atari off a hard drive is more impressive than off a 1050.

Only with a 16-bit machine can one implement a multitasking OS (unless
you count OS/9 on the CoCos). As long as the Atari is an 8-bit machine
it will have some serious limitations.

Certainly the Apple IIGS was 10 times the computer that the Apple II was.

Sort of a late reply, but better late than never! :)

I have the all the programs you mention. The Atari word processor is
only better than using a typewriter in that you don't have to re-type
a page just to add a word or line or whatever.
Other than that, it is a good one to pass on. :) Each page must be
saved as a separate file, for one thing. Using it is a laborious
process, to say the least.

Isn't it interesting to look back and consider that both companies had hired celebrities to tout the products, Commodore's being William Shatner and Atari's Alan Alda (though he came later, I recall).

The Atari 400/800 was a landmark in terms of 1979 technology. The C64 came four years later and had a few features that were nicer, but all in all was still not as impressive. Commodore beat Atari only through marketing.

6704. MULE and other memories

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 07:19:04 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199411280719.AA257017146@relay2.geis.com>
Source record: 96933

Apparently Dani Bunten has refused to work on a new version of MULE for the PC crowd; the changes demanded included guns and bombs. One of the PC games magazines had a brief description of the conflict.

I was reading one magazine with their list of the top PC games ever made; in their interviews with game designers the two games most often mentionned as the best ever were MULE and Star Raiders.

It's kind of strange, really - I see a game like X-Wing that occupies multi-megs of hard disk space and requires a high end PC to be playable, then go back to my 800 and play Star Raiders - an 8k program that will run with 8k of RAM. I've never seen a PC program that good, anything close to that small.

klassa@aur.alcatel.com was asking about that Atari catalog thing:

It's out now. The Atari 8-bit Omnibus - 24 pages plus covers, filled with ads from Atari vendors and developers. One satisfied customer posted to the net "It is very well done... Check it out!"

All this for just five bucks.

Make your cheque or money order payable to me (that's David A. Paterson) and send it to:

Right. And where do people think the Copperlist comes from on the Amiga?
Exactly. Jeff Miner (may he rest in peace) took his design from the Ataris
and just generalised it a bit for the Amiga.

Nope. It's 3 voices with selectable waveform(triangle, puls, noise and sync,
ringmod.).

>I was never that impressed by the C= sprites either. I don't think they
>are as flexible as Atari ones. Multicolor, fine. But what about sprite
>resolution and horizontal double/quad registers? What about using

Yes, you could double the vertically and/or horizontally.

>display list tricks to take a PMG strip and simulate more players with
>it?

I've seen demos with as much as 64 sprites, maybe there are some demos with
more. Game usually don't use more than 16 or 20 sprites usually.

> Changing horizontal position on the strip halfway down and having 2
>images on the strip, there you go, you got an extra PMG to manipulate.
>What about PMG priorities? Etc..

You could change the xpos whenever you wanted, and image. You could also
select sprite/background priority.

The VIC wasn't bad...

>on a C64 is split up into 16K blocks.

Only for the VIC. The CPU can reach every single byte. Perhaps you meant the ROM/IO-switch? The C64 has basic rom at $a000-$bfff, io area at $d000-$dfff, kernal rom at $e000-$ffff. Those coulde be switched out by writing to address $1.

Hi everyone,

I just picked up 3.0 and think it's really cool.
I will be releasing a new version of SpartaDOS
specifically for use with the Xformer (2.5 included)
SpartaDOS is up and running NOW, and I should be
able to get an ATR file up to the networks in the
next week or so. More Later... Mike

6714. DiskCommunicator 3.2 (repost)

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 14:13:15 UTC
From: nthewarapp@ea.com
Message-ID: <nthewarapp-2811941413150001@nthewarapperuma.ea.com>
Source record: 96944

I'm posting this again, in case it didn't reach everyone(?)

I've tried 5 different copies of Diskcomm, but all were the same version (3.2) and the same file size, 13,054 bytes (jeez I remember the file size even though I'm nowhere near my Atari!).

I'm using a 3.5" 720k drive attached to my Atari to transfer files, and always do a binary transfer. I also tried transferring an ARCed Diskcomm and de-ARCing on the Atari, same result.

Do you know where I could find a different version of Diskcomm other than 3.2?

Here was the response I had from Robert Stout (thanks!):

RS> Tryto get another copy of diskcomm. Use a different sio2pc program
RS> (I use util.exe with the b for binary switch on). Good luck.

Here was my original post:

I'm having problems making disks using DiskCommunicator, I hope someone can give me some help!

I just got my Atari system going again after buying a 720k 3.5" disk drive at AMS allowing me to transfer files found on the Internet to my Atari.

My Internet Connection is via a Macintosh, so I FTP files from umich, put them on a 720k IBM PC disk, take them home, stick them in my Micro Discount 720k floppy and transfer them with Robert Puff's IBMREAD program to Atari disks. .ARC files transfer and de-ARC OK, but I'm having problems with .DCMs.

I'm running DiskCommunicator 3.2 (12/87), with verify on, I have formatting set to on, the program seems to read the files OK, formats the disks in my 1050 OK, and seems to write the sectors OK too, but the only .DCM I've managed to turn into a bootable disk OK is INTELB.DCM. All the other disks have just loaded 3 or so boot sectors in on bootup and then zilch.

.DCMs tried without success
---
big1.dcm

big2.dcm
halle93a.dcm
rayofhop.dcm
sweeta.dcm
fted32f.dcm
intela.dcm

.DCM tried with success
---
intelb.dcm

My System

Atari 800XL (PAL)
Atari 130XE (PAL) - tried both 800XL and 130XE, same results
Atari 1050 drive with Hyper Drive DD and Warp-Speed enhancement
(I've turned the Hyper Drive off, it doesn't seem to make any difference)
Micro-Discount 720k Disk Drive Interface and Chinon 720k 3.5" drive
(I've removed the interface from the SIO chain, it doesn't seem to make
any difference)

DOS versions tried without success

MYDOS 4.50
SpartaDOS 3.2c

I hope someone can give me a tip, here...this is driving me nuts!

Thanks all!

Neil.

P.S. If you could email me any info as well as/instead of posting, as news
takes about 7 days to get to our site.

Thanks again!

The lesson that Commodore SHOULD HAVE learned is that hardware and
software needs to be userfriendly.

The only lesson commodoreo seemed to have learned is to put dip switches on
the 1541... But for the novice user, it is quite annoying to have to remember
what combination of switches does what. Especially considering it only
costs a few bucks to put a real dial switch in ... With 4 settings instead
of 2 dip switch settings that mean different things in different combination.

Yes, I know about that remedy. The problem really lies in the speed
of the Atari, I think. It's not really fast enough to provide
accurate scanning of the electron beam on the TV.

: "don't put your disks on the power supply" rule?
:
: Also, why did the 1541 get so hot? A disk left in there half an hour
: was almost melted.

Well, both of these problems were addressed confidently with the Commodore 1541-II disk drive. Same basic operation as any other 1541, but it has an external power supply (BIG, BIG plus) and two DIP switches to allow device numbers 8-11. (still a plus, but I would have preferred them up front!)

I have two of these with JiffyDOS on my first 128 system, and two 1571's on my other 128 setup. I only like the 1571's because their power cords go straight to the power bar, and I don't have to put that "brick" on the floor. I have NO NEED for the extra capacity (I have 1581's on both computers also), and I would rather not have the heat or extra length...

>Mvh: Tommy Hallgren

The Pokey chip in the Atari initializes to 4 voices with 8 bit pitch
resolution. There are 3 clocks you can divide by for different "ranges"
They are 15KHz, 64KHz, and 1.79MHz (The CPU clock). There are 3 polynomial
counters used to generate noise. When a voice is set to noise, the pitch
freq. is used as a 'countdown to sample' value, making it a low pass
filter to the noise signal.

There are high pass filters, and 4 bit volume.

2 8-bit voices can be combined into a 16-bit voice, so you can have
4 at 8 bit, 3 (2 at 8, 1 at 16) , or 2 16 bit.

With proper manipulation, Pokey music can sound very good. Some of the
new 8-bit demos sound incredible.

6724. Looking for Broderbund's Spelunker

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 17:14:03 UTC
From: s00670@darrel.digex.net
Message-ID: <3bd34r$qmn@news1.digex.net>
Source record: 96954

Hi all, I'm still looking for a copy of Broderbund's Spelunker, my favorite 8-bit game. If anyone has a copy to sell, or knows where I can get it, please _PLEASE_ let me know.

Darrel

6725. Help! I need...

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 17:19:50 UTC
From: mtmr@walsh.dme.battelle.org
Message-ID: <mtmr-281194105922@walsh.dme.battelle.org>
Source record: 96953

Well I just got back into the 8-bit stuff with a 800 and a 1050. I got a bunch of games with it but am really looking for someone willing to send me some of my old favorites...

-MULE (>>really<< need this one again!)
-Dropzone
-Decathalon
-Pitfall II
-Frogger (the J. Harris edition)
-Montezuma's Revenge (not the Parker Bros. version, tho)
-Flak
-Whistler's Brother
-Alley Cat

Now before the self-righteous expound on the evils of pirated software, let me first tell you that:

1) I had purchased most of these titles long ago but gave it all away to a friendly kid in my neighborhood
2) I am more than willing to buy them again if you can tell me where
3) None of the software companies that made these games that are still in business (ECA, Activision, Broderbound) care about this old 8-bit stuff anyway.

Even if you have only a couple and are willing to help me out, please respond!

: dont want to invest in a new computer or for sentimental reasons... or
: perhaps you like the machine better..?? I'm just curious... I still use
: my C64 because of the Brilliant programming done in the 80's.. I once had
: an 800XL, great computer.. I had "The Pawn" for it.. best graphics I ever
: saw on an XL screen. You guys have fun... those are great little machines.

I use my 800XL/130XE computers because they're *fun* at what they do!
I realised recently that although my Amiga is a great machine, I did a lot
more experimenting on the XL which dropped into BASIC dead easily. Altough
AMOS Pro on the Amiga is a very powerful way to harness the Amigas graphics
without machine code, for some things, the XL is less hassle and more fun.
With the XL, I feel I could, if I ever got good enough push the machine to
its limits. On the AMiga, it'd take a lot longer to be good enough to
program the machine at its very best. Also, there are still things on it which
impress me...

I always said that I would never sell any of my 800XL stuff to buy an ST.
I'm glad I didn't, because when I did buy an ST to *go along with* my 800XL,
I only had it a year, before dumping it for an Amiga 500Plus...

I remember listening to a documentary on the radio a few years ago- it was about the Trident recording studios. There they had a piano which everyone agreed sounded great, and was used in quite a lot of famous records. Then at some stage, someone decided to have it refitted or something, tuned up, and generally improved. Apparently after they did that, the piano lost it's magic sound, and ended up being very ordinary and run of the mill. 'Nuff said?

Actually Ben, I agree that CPU horsepower MAY not be a factor in the ability of the Atari 8 bit to successfully render high quality schematics, but the Atari 8 bit architecture and programmers' resources ARE.

That old 130XE memory banking scheme makes a complex program like schematics difficult to program. Though workarounds exist for CC65 and Action!, they certainly don't make writing large, complex programs easy. Neither does having to program for the least common denominator. Some memory upgrades offer toggle-able Antic access to banked RAM, others force Antic to see always see the main bank, or to always see the same bank the CPU sees.

Having no standard for DOS doesn't help. Once again, you have to program for the least common denominator: DOS 2.0, which means 90 K disk, no subdirectories, and significantly less main memory than SpartaDOS X can offer.

It's too bad that Reeve Software's Diamond GUI package didn't materialize in a more workable, more widely purchased form. At least with Diamond, much of the user interface programming had already been done by Alan Reeve. I spent weeks coming up with my own mouse driver, and a graphical arrow pointer to go along with it!

In theory, the Fine Tooned Mars8 board, with a 65816 and resultant flat memory design would certainly make a programmer's task easier, IF a programming language (no, not assembly) came with it that addressed those features, and IF thousands were sold so that a programmer could write code confident that his intended market all owned the proper hardware to run the program!

If we had access to the technology that Fine Tooned is designing 5 years ago, and it sold to the massess, then I think my tune would be different. But now, there are some areas which I think will remain out of reach of the general 8 bit user. Schematics is one of them.

Building custom modes is a pretty easy thing to do, it can even be done from
BASIC. I've managed to squeeze 208 lines out and still get a perfect display.
(This was on a PAL TV though which have more horizontal lines to begin with).
I think the top limit is at around 210 lines, after that ANTIC/GTIA just can't
cope with the extra display lines and the top of your picture gets warped, go
further still and the screen starts to roll.

>know there is also a poke to compress the screen down horizontally. I
>don't know if it will let you widen the display beyond 320 pixels, it
>might. My monitor wouldn't show the overscan if it did.

Yes, you can widen the display too, to a maximum of 384 pixels wide. Of course
this will go off the edge of the screen on most/all displays. The reason for
doing this is to allow smooth horizontal scrolling, allowing the picture to
go off the edges of the screen means that you cannot see the edges of the
picture being drawn/deleted, plus you don't get an annoying vertical edge along
the side of the screen. Next time you see a scrolling message on a demo,
notice where the text appears. It gives a much better effect if it starts
appearing on the edge of your screen rather than a little way in at the margin.

One other point to note in the graphics architecture is how the CPU clock
is precisely sync'd to the raster scan. 1 CPU cycle = 2 colour clocks. This
allows for some impressive effects, such as switching colours, Player Missile
positions and even graphics modes half way along a horizontal scan line.

From: heller@akh104.rh.psu.edu
Message-ID: <3bde4u$bsu@hearst.cac.psu.edu>
Source record: 96964

The main concept I wanted to implement was the ability to slap on
a 1050 drive to a dos/unix machine and copy to and from the drive
without worrying about density or dos...

It would a) use atari dos 2.0/2.5 formats and use sparta dos formats...
(I dont know enough about mydos...)
It would support the US Doubler... and my Duplicator board.
It would do SS/SE/SD.

NOW, however, the concept of making a PC look as if it were a drive
to an atari is very tantalizing. Sorta an SIO2PC concept but could actually
use the native ibm's file system... That way I could have a nice directory
filled with atari stuff...sub directories and all..on my ibm and be able
to look at the files, edit them...and run them from my 8bit.

Of course... this is A LOT EASIER done under UNIX than DOS.
So.. it would be done in UNIX first I would guess. =)

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 20:53:50 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <3bdg0u$bsu@hearst.cac.psu.edu>
Source record: 96967

I have not yet read all 60 (?!?!?!) articles under this thread but
here are MY opinions based on research projects.

First and foremost it is imperative to understand the following:

Atari did not just (as in only cause) screw itself over in 83/4/5...
and fall over and die. EVERYBODY during this time period fell over and
went out of business. (Speaking figuratively, of course.) Atari survived.
TI went bye bye with their computers...as did Timex... commodore....
and the game companies (this was the great game era people!) coleco...
Matell... and only Atari made it through...

As for wondering why the Apple made it through longer than the other people
let us not forget they just about started the home computer market.. the PC
market... whatever... They were out before the Atari systems and were a major
source of fun for hobbiest. IBM wasnt even in the market until the end of '82.
IBM couldn't make a PC if they were given the schematics... (Atari offered
IBM to slap their name on their machines and IBM refused.) Eventually, IBM
told some of their engineers to go and "do it" and they were given 100%
freedom from the bureaucratic BS that IBM is known for. (Still, the day
before the PC was reveled to the world, IBM flew techs all around the world
to fix a small flaw in the design of the power supplies.. apparently, too
much dust could build up between the fan blades and the outer case and short
the whole thing out. Apple, it its ever increasing humor posted in the
news papers that very day: Apple welcomes IBM to the home computer market.)

But, I digress...

As for piracy, it was well known, at least among my piers that Atari users
were the most notorious "crackers" around, for both software, mainframe systems
and Phreaking. How much this contributed to the downfall is questionable.

Commodore's were marketed as if we were going to war! In every magazine,
on every TV set you found adverts for the C64 or the V20. It was purchased
by those people who were at the time computer illiterate. Whereas the Atari's
were purchased by those people who KNEW something about computers.

I myself was dying to get a C64, JUST LIKE EVERYONE ELSE I KNEW WAS, and then
one day, in Boscov's department store probably out in Hazelton PA. I saw
a 800XL. I played with it for 5 minutes and completely changed my mind as
to what I had been wanted for the past several months. The little things about
it won me over. In particular the basic editor was fantastic, compared to
the C64. On the C64 I never understood that stupid " mode, where the
arrow keys no long function once you begin a ". AND...the 800XL was damn
sexy. The C64 looked like it was from some cheap sci-fi film. The Atari
looked like it was superior and later on I found out just how fantastic the

OS was designed... how wonderful the hardware internals were put together.
And to this day it still amazes me how the Atari was a multi-processor
system. I hung out at a repair shop a lot and the CPU in the 64 was
almost always the culprit.

Where was this post going? hm..I think I will read some more...

I upgraded my 1541 to 'Dolphin DOS' some years back. Since then, the drive
crashes when trying to fast save once it has reached 'running temperature'.

I now have to run the drive with the lid off. It cured the problem, but
it doesn't look too pretty and it doesn't half collect the dust.

The thing that really worried me though was the power supply for the
64 itself - you could almost fry eggs on it.

6740. non-standard 3.5" disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-28 23:09:30 UTC
From: potter@sunny3.DAB.GE.COM
Message-ID: <3bdnva$ks3@theopolis.orl.mmc.com>
Source record: 96970

I've just recently picked up a 3.5" disk drive (Sony MP-F52W-50, out of an old HP 9122 dual drive "box"). I have the CSS XF551 conversion, which should allow me to use this drive. But it's not standard. The Sony expects power (+12, +5V) on the 34-pin cable, not four separate pins. So I wired it up correctly. Now at least the drive spins up, but I am unable to read, write, or format a disk. I have the slide switch in the right position (otherwise it doesn't even spin up on power-up, or when I send a command to the XF551), and I'm only trying to use DSDD (720K) disks.

Can anyone point me to schematics or documentation on this Sony unit? Or maybe the standard 34-pin connector's pinout?

Thanks in advance!

Another reason the Commodores did well was the fact that people disassembled the machine down right to the bones quite quickly after it was sold. I could buy a complete memory-map and ROM access point book, which allowed me to do alot more with the machine. Another (possible) factor was the transition from the Commodore PET.

I was watching the 8 bit war when these two companies were fighting it out and would like to comment a little.

Technically commodore was slightly ahead in sound and sprites while atari had a better machine speed, easier graphics, perhaps a better basic. Although the basic performance on atari was slow which meant you didn't notice the raw machine speed. Price was a big factor I think.

One thing commodore did was buy a chip maker which they promptly used to develop video chips. The VIC 20 is testimony to the Video chip since the video chip is what made the vic20. The 64 continued the trend. A cheap price with a sophisticated video chip.

Atari was too late in entering the market. The membrane keyboard was not received well and everyone expected 2600 cartridges to work. They didn't of course which I think hurt the company. They could have easily made them work.

Aha! Every program you listed as a failed UNdiscom was created in
Atari dual density. Your 720k drive can't handle Atari's very
odd 128k format scheme - but is probably limited to 80k and 180k..

I use my networked XL's and XE's because of several reasons:

1) Fun to use
2) Easy to hack
3) Cheap to hack, see #2 also
4) Nice to get away from the Novell and Unix networks I sysadmin
5) No need for high powered Pentium 100mhz at home
6) Games are fun and make me remember how life was at 13yrs old
7) My atari can do almost everything my PC's can do - some even better
8) Theres something cool about telling folks I use a 1983 machine at home
when I know more than they do about Unix boxes and Novell!

Any other questions?

Hard drive OPTIMIZER for SDX? What would you compare it with?

Cleanup.com for SpartaDos 32d.dos? It too will work under SpartaDos
if you go "X CLEANUP Dx:", or you can download a SDX version which
will run without the "X".

I have the following 8bit Atari hardware for sale or trade.. Unless
otherwise noted, all equipment is in near mint condition - complete
with all cables and power supplies:

---

5 x stock Atari 1050 disk drives (SS, ED)
3 x stock Atari 800xl computers (64k ram)
2 x CX85 keypads
2 x 1020 40 col. printer/plotters
2 x 1025 80 col. nlq printers
1 x 1027 80 col. dot matrix printer
1 x Commodore 1702 split luma/chroma monitor
5 x Seagate ST-225 20meg hh hard drives (formatted on MIO)

>magazines had a brief description of the conflict.
>
There is a game for the PC that follows in the tradition of MULE. In fact, its an ovious MULE ripoff. Its called "Traders" and sells for the Amiga and PC. I was dissapointed because the buying/selling part is not a free market like in MULE.

Anyway, yeah - MULE was the best game on the Atari 8-bit. Star Raiders was only 8-K but was great for its ease of use and depth of play. The first real game to meet that criteria on the PC is DOOM.

Interesting how great games seem to "reveal" themselves. No matter where you were around the country, when you picked up MULE you loved it. Games that big have a huge following throughout the land - like Star Raiders did.

Umm.. they entered the computer market in '79. The technology difference
between the 2600 and the 400/800 was fairly large. 2600 code is machine
cycle dependant. The code often needs to know how far into a scan line it
is, and what scan line it is on. Since the 400/800 had faster CPUs and
automated frame maintenence, 2600 code would need a lot of extra support
hardware. I doubt this was a major factor since all computer designs
had faced the no software dilema at first. Yes, the membrane keyboard
was a pain, but in '79 you couldn't buy a cheaper color computer than the
400.

> Atari did not just (as in only cause) screw itself over in 83/4/5...
>and fall over and die. EVERYBODY during this time period fell over and

This is a bit off of your subject, but I was just re-reading some of the
1972-1987 "mainstream" articles I photocopied during a self-serving
and self-directed research project in college, and found the
following interesting items:

from "Business Week", September 13, 1982:
Sales (billions of dollars) 1981 1982 1983
Warner.....$3.2 $4.3 $4.8
Atari.....$1.1 $2.0 $2.4
Atari's Share..... 34% 47% 50%

Operating earnings (millions of dollars)
Warner.....$442 $720 $826
Atari.....$281 $504 $571
Atari's share..... 64% 70% 69%

[My comment] So, Atari was providing about 70% of Warner's earnings
at the height of its success. Nice, huh? So, was Warner grateful?
No, not in the long term...read on...

From "fortune magazine", July 9, 1984:

[Discussin of recent big losses at Atari deleted, and tale of Morgan's
being hired also deleted]
"Morgan didn't see it coming: his 1984 budget called for sales of about $1
billion. In late March, at a meeting at Warner's New York headquarters,
Warner's top brass sent him back to the drawing board. Warner's Chairman
Steven Ross was at the meeting, battle-scarred from a takeover skirmish
with Australian publisher Rupert Murdoch. Also present was Herbert
Siegel, chairman of Chris-Craft Industries, which had helped Ross fend
Murdoch off and ended up controlling 29% of Warner's voting stock. As
Morgan recalls the meeting, Siegel politely said of the $1 budget,
"Everything has got to go exactly right for you to meet this budget.
There's no breathing room. You've got to give yourself breathin
room."
"...revised budget callin for a shrunken company with sales of $500
million and profits of $50 million to $100 million."
"Warner could use the profits. The company borrowed heavily to fend off
Murdoch and bought back his stake for $172 million. Last quarter's
interest bill was $41 million, particularly painful since Warner's
loss from operatins was $50 million. Ross indicated that Warner wouldn't

put another dime into ATari-and that the subsidiary must produce some cash for the parent. Warner would like to sell Atari or a piece of it, but not at a fire sale."

[My comments] So, after being Warner's cash cow for four years, ATari is given NOTHING. They're in trouble, need leadership, direction, and most of all $$ to re-grow their company. Instead, Warner leveredged itself so badly that it couldn't help Atari if it wanted to!
While Marketing is not Atari's strong suit, certanly warner's treatment of the subsidiary is also an underlying cause of the downfall. (Not to mention the people they put in charge! A textile industry exec? A cigarette marketing exec? Neither of which knew ANYTHING about consumer electronics, let alone the new industry of personal computers.)
I place the blame for Atari's downfall squarely at Warner's doorstep. They decided who was in charge. They decided how to run things and what to do with profits.

The 400/800 came out in '79, and the C64 was released in '82. IMO the C64 was really just a cheap ripoff of the Atari 8-bits. It was a rock-bottom priced implementation of already-existing technology. It won the price wars hands-down. (Tramiel did the same thing later at Atari, when he released the 520ST...there was really nothing "new" about the ST, but it was a good deal for the $ in '85.)

When C= was releasing the C64 in '82, Atari released the ill-fated 1200XL computer. Priced at $799, it offered nothing new (except an extra 16K) and had an incompatible OS.

Atari finally realized what was happening, and scrapped the 400/800/1200XL in favor of the lower-priced (and overseas built) 600XL and 800XL. But by the time they were released, it was too late, and C= had already managed to take over much of the market.

They should have seen it coming, and if they were going to try to compete on price they should have had their cheaper models out *much* sooner. I think most of this can be chalked up to the awful management at Atari, Inc.

Excellent story,and good point.

My feeling is, if you "upgrade" the Atari by opening it up and pulling
stuff out and putting other stuff in, you're not improving it..you
are making a new machine, or at best a hybrid.
A plug-in module offering increased RAM is fine. the Black Box is
a good idea for those who feel they need a hard drive. But messing
with the OS or "updating" Antic or GTIA is going too far, IMHO.

Agreed! And the 800 (which came out at the same time) had a
regular keyboard. The Atari 8-bit had more advanced graphics and sound than
computers which came on the market as late as 1985 ... Tandy CoCo III comes
to mind. Considering than the C64 came onto the market years later, it
isn't that impressive or innovative. If the sound chip is better, it
isn't better by much and the Atari XL beats it in most other respects.

I'm glad you included that disclaimer, Andrew.

: As for piracy, it was well known, at least among my piers that Atari users
:were the most notorious crackers around, for both software, mainframe systems
:and Phreaking. How much this contributed to the downfall is questionable.

I don't think so....C64 users wrote the book on pirating, as much as it
pains me to say. :(((But Atari crackers were probably a very close
2nd :)...numerically...

:Commodore's were marketed as if we were going to war! In every magazine,
:on every TV set you found adverts for the C64 or the V20. It was purchased

Really?? Commodore's recent downfall has been attributed to bad
marketing. Maybe Tramiel was worth the large space he took up after all! :)

:by those people who were at the time computer illiterate. Whereas the Atari's
:were purchased by those people who KNEW something about computers.

Nope, Atari had a friendlier basic. They were bought by people who preferred
(maybe needed??) the ease-of-use and were willing to pay a *higher*
price to get it. The true hacker didn't care about ease-of-use,IMHO,just a
machine for a good price. Seeing as how the 800xl and C64 were nigh-brothers
in terms of overall stats, (ie., they balanced each other.. if 800xl had
better video, c64 had better sound, etc..this has been debated for a long
time :), price meant a difference to those who KNEW something about
computers and something about money....

A lot of people did start out on C64 (same w/atari). If you started out a
novice on the c64 and were able to figure it out, you would have earned
the equivalent of a MSCE :)))))))). I think Northwestern accepts C64 credits.
:))))))))))))))))))

:I myself was dying to get a C64, JUST LIKE EVERYONE ELSE I KNEW WAS, and then
:one day, in Boscov's department store probably out in Hazelton PA. I saw
:a 800XL. I played with it for 5 minutes and completely changed my mind as
:to what I had been wanted for the past several months. The little thing about
:it won me over. In particular the basic editor was fantastic, compared to
:the C64. On the C64 I never understood that stupid " mode, where the
:arrow keys no long function once you begin a ". AND...the 800XL was damn

Hmmm.. I don't know what "mode" you are reffering to..whoops, No MSCE here! :))

This is quite interesting. I had a similar experience at Zayre's :). I rated both machines identical and went for the C64 because of the much much lower price. Years later, I would have the good fortune of getting an 800xl and still could not notice advantages by either machine that wouldn't eventually get cancelled out by something else. (stock equipment mind you)

Mike

6761. 8Bit Atari hardware for sale

Memory would be a limiting factor too, but I think you really need a
processor designed for multitasking. I'm sure you could do true
multitasking on an 8 bit processor, but probably not a 6502.

>PS: I think the CoCo's ran on 68000's ? If so, then they were running on
> 16/32 bits.

The TRS-80 Color Computer?! No way was that 68000! That thing seemed
more primitive than Ataris or Commodores! I thing it used a 6809,
which is slightly more advanced than the 6502 -- it has some 16-bit
registers and instructions, and some extra instructions. I believe
OS/9 is an operating system for the 6809, but I don't know anything
about it.

Was is really that slow? Someone once told me that Atari 800's 6502
was clocked at 2 MHz, so it should have had a considerable edge
over the C64's 980 KHz CPU.

6765. printer_interface_+_MAE_assembler

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-29 11:20:31 UTC
From: opg@elcom.pub.ro
Message-ID: <m0rCLib-0002ZqC@elcom.pub.ro>
Source record: 96994

Hi, everybody.
I'm looking for a parallel interface for my Atari 130xe. Does anybody have one for sale at a reasonable price? I'm a student in Romania and have very little money since wages are so low around here (about $100/month on the average).

Does anybody know if John Harris still subscribes to the Digest? I've been trying to contact him about his MAE assembler since September with no success.

If anybody can help at these matters, please e-mail me at opg@elcom.pub.ro since I don't read the digest any more (I wish I did, but I just don't have the time)

Thanks!
Octavian Grecu

6766. multitasking - 6502?

Newsgroup: comp.sys.atari.8bit

In article <3behj4$652@charm.magnus.acs.ohio-state.edu> rfunk@magnus.acs.ohio-state.edu (Rob Funk) writes:

>Memory would be a limiting factor too, but I think you really need a
>processor designed for multitasking. I'm sure you could do true
>multitasking on an 8 bit processor, but probably not a 6502.

Yes, mem is a limiting factor for the 6502, but its flat memory model makes it much easier to design real mem management (for a multithreaded evironment) than 8088, etc.

6767. MASSIVE AUCTION V -- update #3 (includes 130XE w/disk drive)

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-29 12:23:17 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3bf6fl$ijs@usenet.INS.CWRU.Edu>
Source record: 96995

UPDATE #3:

MASSIVE AUCTION V -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COLECO ADAM
COLECO 2600 ADAPTER COMMODORE 64 INTELLIVISION INTELLIVOICE
ODYSSEY2 PONG (2 types) SEGA MASTER SYSTEM TOMY TUTOR
TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

NOTE: Update #2 never made it up yesterday. I sent it, but it never
appeared. Due to this, and the fact that I have finals on the
original end date of the 5th, as well as the 6th, I'm extending
the deadline one day, until midnight on the 6th. This way I won't
have to worry about staying up and sending out messages to the
high bidders all night on the 5th.

****

This is a rather large file (32,234 bytes, 1086 lines), so if you don't like
large files, and/or auctions, please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is accessible. I will also e-mail the list to all
bidders, and anyone who requests to be placed on the auction e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON TUESDAY, DECEMBER 6TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN
PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX ITEMS!)

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO
PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #8)

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER,
DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A
CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY
WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH.

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

AIR-SEA BATTLE (Atari)
ASTEROIDS (Atari)
ASTROBLAST (M Network)
BERZERK (Atari)
COMBAT (Atari)
E.T. THE EXTRA-TERRESTRIAL (Atari)
MISSILE COMMAND (Atari)

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

SEARS TELE-GAMES (ATARI 2600 COMPATIBLE SYSTEM) WITH BOX, MANUAL, ONE (1) ATARI JOYSTICK, ONE SET OF TWO PADDLE CONTROLLERS, AND NINE (9) SEARS TELE-GAMES CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

BASEBALL (Tele-Games)
BASKETBALL (Tele-Games)
BOWLING (Tele-Games)
BREAKAWAY IV (Tele-Games)
FOOTBALL (Tele-Games)
GOLF (Tele-Games)
PONG SPORTS (Tele-Games)
TANK-PLUS (Tele-Games)
TARGET FUN (Tele-Games)

THIS IS A COMPLETE 2600 SYSTEM, EXCEPT FOR RF SWITCHBOX AND POWER SUPPLY.

THE BOX AND MANUAL AREN'T IN GOOD SHAPE, BUT BOTH ARE INTACT.

MINIMUM OPENING BID OF $60.00

*****

LOT #5

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND TWO (2) GAMES [NO BOXES OR MANUALS FOR GAMES]:

DEFENDER
POLE POSITION

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THE POWER SUPPLY WORKS, BUT AFTER TESTING IT I DISCOVERED THAT THERE ARE EXPOSED WIRES AT ONE POINT ON THE CORD. I WOULD SUGGEST NOT USING IT, AND I ONLY SUPPLY IT SO THAT YOU KNOW WHAT ONE LOOKS LIKE, AND CAN READ THE SPECIFICATIONS FROM THE POWER SUPPLY ITSELF.

MINIMUM OPENING BID OF $32.00

*****

LOT #6

ATARI 5200 (4-PORT), ORIGINAL POWER SUPPLY, ONE ATARI CONTROLLER, AND TWO (2) GAMES [NO BOXES OR MANUALS FOR GAMES]:

POLE POSITION
SUPER BREAKOUT

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

MINIMUM OPENING BID OF $35.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

6768. The ADOS Project (Ref: New Standard)

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-29 12:49:47 UTC
From: MBITDC9306@titan.newi.ac.uk
Message-ID: <9411291251.AA04165@dylan.newi.ac.uk>
Source record: 96996

Last night, when tinkering about with ideas for a Windows environment for the 8-bit, I began thinking about all this talk about a new standard and how support for extra devices (RAM upgrades especially) could be incorporated into it. The thing is, I am going to need some help and feedback on this. Some of the ideas I came up with were:

1. Windows-based operating system which replaces much of the original 8-bit OS.
2. Autodetecting of various RAM upgrades. Should also include automatic handling of bank-switched RAM. By this, I mean that it can treat bank switched RAM as one large block of RAM (shouldn't prove too difficult to write such a RAM handler).
3. Allow inclusion of additional bolt-on device drivers such as various printer drivers.
4. Should have GDOS compatible fonts.
5. Full set of windows, drop-down menu, font and icon manipulation routines. After all, ADOS is short for 'Atari Developer's Operating System'.

There were some other ideas but I haven't got the notes with me. One thing I would like to do is to get a group of contributing programmers together over the 'net to exchange ideas and to do some coding on this over the next few months.

This sort of arrangement has worked well on the Pov-Ray (Persistence of Vision Raytracer) project on the PC. If you are interested in taking part then you can mail me direct. I can do some of the project myself but need your help to do the rest.

Of course, if anyone has any further ideas, then feel free to mail them to me or to the newsgroup.

: What? Jeff Miner is dead? This is the same guy who helped design
: the Lynx, the 800 and the Amiga right? That's terrible!

Jay Miner, sadly *is* dead. I didn't know about him being involoved in the
Lynx design though. My brother has a Lynx- it's brilliant!
Unfortunatley, there isn't that much support for it, and my brother's has
a faulty joypad. But I still think they're *sooo* cool.

BTW there is also a guy called Jeff MinTer, who wrote Attack/Revenge of the
Mutant Camels, and more recently Tempest 2000 for the Jaguar. Perhaps you
were getting their names confused?

: The TRS-80 Color Computer?! No way was that 68000! That thing seemed
: more primitive than Ataris or Commodores! I thing it used a 6809,
: which is slightly more advanced than the 6502 -- it has some 16-bit
: registers and instructions, and some extra instructions. I believe
: OS/9 is an operating system for the 6809, but I don't know anything
: about it.

You're right- the Dragon, a UK machine which was very near identical,
except it had a real keyboard, and a few different ROM routines also used the
6809. Apparently it was possible to port code between them with very little
change...

Would you care to explain why a general purpose processor isn't able to multitask? :-) I'm sure it's very possible and not too hard either.

Ask me again in about a year. By then I'll know enough about
microprocessors and operating systems to answer more knowledgably.
Maybe even more truthfully. :-)

I'm mostly basing that statement on what I know about both 8-bit ML
programming and what's been happening in the Intel-based world in the
past decade. True multitasking (not task-switching) did not become
possible on x86 machines until the 286 and its protected mode.

I admit that I really don't know much yet about how multitasking is
accomplished on the processor and OS level, so I could be totally
wrong.

I was thinking that there wouldn't be any way for the OS to sneak a
software interrupt in the middle of the current program, but now that
I think about it, I suppose it could be all hardware interrupt driven,
with the clock generating an interrupt that calls the operating
system, which then decides who to give control to next....
(Why do I suddenly feel enlightened? :-)

I bet this is entertaining (or frustrating) for those of you who KNOW
how multitasking is commonly implemented, watching somebody try to
figure it all out.

The following is a hucksterish plug for Toad Computers Holiday Festival '94 which will take place this weekend in Severna Park, Maryland. If you are not interested in this or cannot attend, please feel free to skip this article. Thanks from the folks @ Toad Computers.

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94! -- DEC 3 & 4, 1994
==========

== THE SHOW IS APPROACHING FAST! ==

IF YOU'RE LOOKING FOR ATARI EXCITEMENT, DON'T MISS
TOAD COMPUTERS HOLIDAY FESTIVAL 1994!

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis (eat the great local seafood!).

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Bob Luneski, Oregon Research
- Jim Fouch, Fouch Software (Mailing Manager ST)
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

ATARI ST / TT / Falcon, Jaguar, Lynx, Portfolio and 8-Bit!!
Come SEE IT ALL at the nation's premier ATARI Outlet!

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

LOTS OF FOLKS KNOW ABOUT THE SHOW:

- 5000 Postcards Mailed in mid-November
- Featured on the back of our latest catalog
- Advertised in Current Notes & ST Informer
- Advertised Electronically (Internet et al)
- Highway Signage

SPECIAL ICD PROMOTION:

ICD is offering a special promotion at the show. Buy an
AdSpeed ST/STE for $159 _INSTALLED_. The board will be
installed & your computer shipped back to you FREE or,
time permitting, the board can be installed at the show --
ABSOLUTELY FREE!

This is a great opportunity to get your ST going faster
and save a little CASH! Bring your machine to the show
to take advantage of this great deal!

A SAMPLING OF WHAT WE'LL HAVE FOR THE SHOW:

- Falcon030's (LOW!) - Hard Drives
- TT030's - Hand Scanners
- 1040STE's - 450 Mice
- Stacy's - 125 Trackballs
- Mega STE's - Joysticks
- Laser Printers - ALL NEW SOFTWARE
- CD ROM Drives - STraight FAX! (Show Special)
- Monitors - Disks
- Power Strips - Mousepads
- Books - 8-Bit Hardware
- ST Hardware - Games
- DTP Software - Printers
- Multimedia Speakers - Internet Demos
- Lynx / Lynx Games - Jaguar
- NEW JAGUAR TITLES! - Codehead Stuff
- Printer Ribbons - FAX Modems

- Great deals on all hardware and software
- Full selection of Atari hardware & software
- Atari Falcon030 Computer Systems at Special Discount Prices
- Super Low Clearance Prices on a wide range of items

including discontinued hardware and software, store demo
equipment, and much more!
- Our Toadally Cool Dog, Zoe

- Free Hot Apple Cider (and cookies if you're good!)
- Special "Kid Korral" with fun stuff, like crayons
- Dave Small's Own "Live Rust" Neil Young Album,
The One To Which Spectre was Programmed!
- Demos of hardware and software!
- NETWORKED JAGUARS!

=== MUCH, MUCH, MORE! ===

OTHER COOL STUFF WHICH IS ON ITS WAY TO US (As We Speak):

- Over 14,000 ST Games
- ImageCopy 3.5CD (Supports Photo CD Pictures)
- NVDI 3.0 (New Version)
- MagiC (Newest Version)
- Desktopper (Falcon Case)

STUFF WE'RE GIVING AWAY:

- Jaguar System (Raffle to Benefit Habitat for Humanity)
- Jaguar T-Shirts, Mugs & Bumper Stickers
- Codehead T-Shirts
- Free Toad T-Shirts to First 25 Attendees
- Games
- Lots more!

How much would you pay to be a part of a celebration like this? $3.98?
$14.59? $75.00 Non Refundable? Well, no need! Admission to TOAD
COMPUTERS HOLIDAY FESTIVAL '94 is ABSOLUTELY FREE!

In the immediate area is historic and scenic Annapolis! Annapolis had
been the capitol of the thirteen colonies under the Articles of the
Confederation. Its historic state house is the oldest in use in this
country and its white dome was built without the use of nails.
Annapolis has a truly quirky personality that is a combination of
southern hospitality, northern charm and historic clout. For you
military buffs, Annapolis is the home of the United States Naval
Academy. It is open to the public and features several museums,
exhibits, and historical buildings. Annapolis is also home to some of
the best seafood in the world, straight from the Chesapeake Bay.

Toad Computers is TEN MINUTES away from downtown Annapolis.

Also nearby is Baltimore, home of the recently renovated and world
famous Inner Harbor -- a huge shopping and eating fiasco that's
just minutes from some of the city's most historic sites. In the
inner harbor area, you can visit the National Aquarium (home to
thousands of species of marine life) which also features a working
rainforest in its pyramid shaped dome. Visit the Maryland Science

Center, home to a huge I-MAX theater and also packed with hundreds of constantly changing exhibits that relate to science, computers, and more. Visit the home of Babe Ruth, Betsy Ross, or Edgar Allan Poe. See the new stadium for the Baltimore Orioles -- Oriole Park at Camden Yards. You might also want to visit Fort McHenry -- the rampart that still stood after a night of bombardment in 1812 that led Francis Scott Key to write our national anthem to the tune of an old drinking song. Find out why this happened! Visit the B&O Railroad Museum where you can learn about the story of the rise and fall of the greatest form of transportation this country has ever known.

Toad Computers is THIRTY MINUTES away from downtown Baltimore.

Lastly, you may want to make a stop in Washington DC -- murder capital of the world and Capitol of the United States. Where else can the mayor of a city smoke crack and get RE-ELECTED? Come see the White House -- maybe you can visit Bill Clinton at home and give him your ideas for healthcare reform (yeah, like we're gonna see that anytime soon). Visit the Smithsonian Institute, National Art Gallery, countless memorials (Iwo Jima, Viet Nam, Jefferson, Lincoln, Washington Monument), and more. There is more to do in Washington than I could ever begin to list here with any justice. If you do want to go to Washington, check with AAA to make sure that you're not missing anything. It is truly a city with something for everyone.

Toad Computers is FORTY FIVE MINUTES away from downtown Washington.

HOTEL ACCOMODATIONS

If you plan to visit the Annapolis area from out of state, there are several hotels in the area that we may recommend:

Sheraton At BWI Airport 15 Minutes Away
(410) 859-3300 On Airport Grounds

Loews Annapolis Hotel 15 Minutes Away
126 West Street Downtown
Annapolis, MD 21401 AAA 4 Diamond Rating
(410) 263-7777 Somewhat Expensive

Days Inn 10 Minutes Away
1542 Whitehall Road Next to Outlet Mall
Annapolis, MD 21401 on U.S. Route 50
(410) 974-4440 Near Bay Bridge

** Holiday Inn 15 Minutes Away
** 6600 Ritchie Highway On Ritchie Highway
** Glen Burnie, MD 21061 (MD Route 2)
** (410) 761-8300 SPECIAL $59 RATE!

Historic Inns of Annapolis For you lovebirds who
(There are several) are just dying to

Church Circle have a romantic time
Annapolis, MD 21401 in the "ancient city."
(410) 263-2641 15 Minutes Away

For more information, please call Toad Computers at
(410) 544-6943.

570 Ritchie Highway
Severna Park, MD 21146

So come see the Jaguar, see Falcons in flight, see Toad Computers (America's Atari Source and the only Atari Superstore), see the local attractions and have fun. And help us ring in the holiday season! We look forward to seeing you!

HOW TO GET HERE:

For a map to Toad Computers and the immediate area, see GEnie ST Roundtable file #25969 (PostScript) or #25970 (Img Format). Or just call and we'll FAX or mail it to you. (This is also available on TOADFAX!, our FAX-on-demand service.)

Come Visit! We're Expecting You!

From Annapolis: Cross Severn River using US 50 bridge (east). Take MD 2 north (first exit across bridge). Turn left at sixth traffic light (McKinsey Road). Turn right immediately into Park Plaza shopping center.

From Baltimore: Take I-695 (Baltimore Beltway) south to MD route 10 (to Severna Park). MD 10 will intersect with MD route 2 south. Take route 2 about 3 miles further. Turn right at sixth traffic light, onto McKinsey Road, then immediately right into Park Plaza shopping center.

From Washington: Take US 50 (begins as New York Avenue) east to Annapolis. Follow directions from Annapolis.

From Columbia: Take MD 32 east to I-97 north (to Baltimore). Exit onto Benfield Boulevard towards Severna Park. Follow Benfield Road to Robinson Road to MD 2. Turn right onto MD 2; second light on

right is McKinsey Road. Then turn right
immediately into Park Plaza shopping center.

Once Inside
Park Plaza: Locate and face Jo-Ann Fabrics. Turn left and
proceed about 200 feet. We are on your left,
across from the Signet Bank drive-through
island.

The street address is 570 Ritchie Highway. If you need any further
assistance, please feel free to call us at (410) 544-6943!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season is a really wonderful time to get
together with Atari folks and it adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

SpartaDOS X also supports high-speed on the Indus GT.

Wasn't there a high-speed add-in module for DOS XL or something? I used
DOS XL way back when, but I never saw the drive use the Synchromesh until I
bought SDX.

>As I also someone who has finally gained appreciation
>for his PC after starting using Linux, I was wondering
>if there are more atari 8-bit users that also run
>Linux on their PC.

I'm running Linux on my 386DX40, which I bought to be able to run matlab and some specialized applications. When the 20 meg hard drive I'd been using (I kept my system minimal and scrounged parts out of principle) started getting a little flaky I bought a 540 megger and used the extra space for Linux... I rarely boot DOS now except for the things for which I bought the PC, and for games. It seems now also that a lot of high-quality DOS software is becoming very inexpensive since the market has shifted so dramatically to windows. Autodesk recently dropped the price on Generic CAD to $99 since they're not going to do a Windows version. That's one more piece of software I've thought about getting for the DOS side since I haven't seen a decent CAD program for Linux.

8-bitters who are comfortable with Daisy Dot will love LaTeX, by the way. Not too much serious stuff I use my XL for anymore. Maybe when I get around to upgrading the video on the 1200XL I picked up this summer I'll get inspired to do something cool with it though...

Not true. The 8088 is very capable of multitasking. Why whouldn't it be
possible to do that?

>I admit that I really don't know much yet about how multitasking is
>accomplished on the processor and OS level, so I could be totally

Multitasking is a OS<->program issue. Not a CPU one.

About 9V means just that. Every RS232 line I've checked actually makes
the transition at .8V to 1.2V i.e. About 0V is read as a logic 1 while
2V => a logic 0. There's a difference between what the IBM BIOS supports
& what the hardware will do is widely known. They pretty much have standard
chips that I've run up to 100k baud *BUT* at those speeds you have to
program the chip directly by writing to it's registers. Just flip through
a DDJ or some other such mag & you'll see ads for C libraries that support
the higher speeds so you don't have to get down & dirty with the MS MASM.
IMHO: Not much will get done, but the way to do it; use LINK.EXE to
add the fast serial port routines to a PD/Shareware runtime module. I think
I have a copy of DeSmet <SP?> C that could be modified. From there just
make a circuit diagram & make a single density version of the program
with the C source code. If anybody needs more then that they can write it
themselves. I don't use that particular compiler myself since the code it
generates is not that quick, but it should give people who don't know
how to use a command line linker a better shot at making a working program.
For that matter, the fast serial routines could be added to any clone
type compiler, but for some reason <fear> I don't want to start tampering
with my copy of Turbo C.

If you are using a PC and SIO2PC (or PC XFormer 2.0/2.5/3.0), I REALLY suggest you get a copy of DCM2DSK2.ZIP, it converts DCM files into ATR files. I use it whenever I get a new DCM file. I DON'T know if it can handle DCMs which have been saved into multiple parts (vs. "one BIG one" as DiskComm3.2 says), but of course those are quite rare (hell, I've seen only one I believe; someone sent a disk file to me via E-mail or something on a BBS).

Anyways, are you getting an error 139?

Also, as to getting another copy of DiskComm (not v.3.2), I don't know that that will help you or why on earth it was suggested. So far as I know, 3.2 is the newest (sorta ashame because it is a bit big for what use I get out of it; sure, it's only app. 13k, but a lot of that is the online documentation which I've read about twice maybe? :))

You can FTP the software (and documents on building the hardware) from atari.archive.umich.edu in the atari/8bit/Sio2pc directory, there are many versions there (why the old ones are still there is beyond me, since 3.15 -> 3.19 seem to be the best and most used).

You can also purchase the hardware from Nick Kennedy (creator) or probably other people for around $50 (I'd guess less since I think it's become cheaper to get the parts; don't quote me; but I DID get mine for free from a friend! :)) OR you can get the PARTS (unassembled) for like $25 or so, just be sure you're handy with a soldering iron (or have a friend who is :)).

Anyways, good luck! It's nice software (although I still would like to see it do MORE MORE >MORE!< :) :) :))

That was it exactly. The machines were more or less functionally equivalent,
but Commodore out-marketed ("I adore my 64", remember?) and under-priced
Atari dramatically. They were quite good at marketing then. Remember the
VIC 20? Commodore sold millions of them, despite the fact that the machine
was extremely limited.

Ok, not to be the person who ruins this admirable record, but....

I had an Atari 800XL, (gift) later sold it and got a C=64. I really
thought it was a step up, tho' this is mostly from a game playing
aspect. Version of Electronic Arts classics, especially Mail Order
Monsters, seemed much nicer on the Commodore- details, mostly.
Plus the entire game market seem much more developed, probably
reflecting a larger number of C=64 owners- for instance, I've never seen
anything that looked or sounded as good as the C=64's Skate or Die on any
Atari 8-bit.

Then again, I never quite found the equal of my bootleg "Last Starfighter"
on the C=64.

Any flame-free feedback? Which made the better game machine, and
what were your favorite games? (Archon! Archon! Archon!)

-Kirk
ps remember those great days of Mastertronic and Electronic Arts
putting the Atari version on the front of the floppy, and C=64 on
the back? Ahhhhh...

Quite interesting as this brings back good 'ol memories. Heres some of my
0.2$. From the early years of my computing and telecomputing, which takes
me back to the days of 1983, here is what I remembered:
Atari bulliten boards were quite numerous, about 50 of them I called
daily, their location varried from California to New York to Florida
to Canada to Europe. The Atari boards ALWAYS had over 500 new messages
in about 1 days time between calls, the C64's didnt even come close
in message bases/posts. {Although this has little to do with the thread}
Ive seen the emergance of FoReM, BBCS, BBS Express, Carina, Amis, PHoReM XE,
Strange Brew Xe, Southern Amis Xe, BBS Ufp!, Oasis {I-IV and Jr},
BBS Express Pro, Carina II. I've dealt with all of them from the setting up,
running, and maintaining point of view.
The Atari ones were the first to have the policy of: ONLY UPLOAD 0 to 1
DAY OLD GAMES!, it wasnt until 1987 that the C64 boards started having
this policy. This makes sense, about 1987 the Atari Software production
started declining while it was in full swing back in 1983+, meanwhile
the C64 started to really boom with Software about 1987+.
The Atari ones were THE Place where everyone would call for Phreaking
info. The Quality of Phreaking posts on the C64 scene didnt come close
to that of the Atari scene until around 1987. However at this time most
of the companies began to seriously crack down on the Phreaking... Many
places were closed up overnight and The SysOp to only be heard of from
again via pay phones or friends. Some bold SysOps merely went out again
and bought new systems and were up and running in under 1 months time.
The Atari ones were also the places where you could find Carding info
more readily than the C64 places. Although the C64 BBSes seem to be the
ones which were still around during the Later years {1990+}. Most of
the info on the C64 systems was OLD NEWS and hence I have witnessed
far more C64 people caught.
So from my memory, the Atari places was where I was introduced into
all that neat stuff {Phreaking, Carding, Cracking}. In the dieing age
of Phreaking and Carding, the C64 carried on the scene, but it was never
quite the same.
During the last days {1989+} I was introduced to the Internet ...

O'ell, time to stop babeling on and head off to my Ethics class. (grin)

Actually, SAM was written by my partner, Mark Barton. I worked on the
synthesis kernel and got it to run in real time. Afterwards we co-wrote
Apple's original MacinTalk, the Amiga's Narrator device, and our current,
fifth-generation system which runs under Windows and OS/2.

In my years of tinkering around on my 64, I've insisted on cleaning the keyboard's innards once a while, getting a drive for the fan, etc.; but until I actually touched the power supply, I never knew it could get so hot. I've started to use a small towel wrapped around the p/s, which I'll keep soaked with water. Does anyone know if this is a bad idea?

>Atari 8-bit.

Well, if you compare the c64 and Atari 8-bit computers as "Game Machines",
the results are different than if you compare them as "Personal Computers".
The c64's righ resolution sprites made a big difference in many of those
EA games. Although they could be replicated closely on the Atari, it was
more work, and those games tended to be written the easy way. :) Also,
it became evident that the c64 versions would make more money, so often
the Atari versions were cheap ports with many features cut.

>Any flame-free feedback? Which made the better game machine, and
>what were your favorite games? (Archon! Archon! Archon!)

I liked Archon, although the c64 version was MUCH better. The Atari
version even had the music screwed up. Ever play Ballblazer on the
Atari AND the 64? The frame rate is MUCH higher on the Atari and it's
full overscan. That's because Ballblazer was a game written around the
Hardware tricks of the Atari. As long as games were designed for the
64, the Atari versions tended to suffer.

The Atari was a friendlier machine IMHO, it had a real bootable DOS with
full disk utilities (none of this LOAD"$",8 stuff! <g>) and better
expansion options. The Atari system could grow easier than the 64.

I don't follow this logic at all. Part of what makes the 8-bit fun is that it can be used in the 1990's with modern hardware. This is what the Black Box (MIO and others) offers. Upgrading your OS gets you even more speed and is similar to ST users running screen accelerators to patch slow parts of TOS (just about all of it <g>). What matters is that the Atari is the controlling element being expanded through channels left open in its design. If the Atari is being controlled externally by a different computer, then what you have is truly a hybrid.

Nice, but its wrong. A negative acceleration refers to a "slowing down"
effect. A plain old 9.8 would be better. Of course adding the "-"
gives the reference frame of down being negative... even thought that
conflicts with "accelerate."

Sorry... too much physics.

I suppose the disagreement arises due to differing views of what
makes the ATari 8-bit what it is.
To me, the OS, ANTIC and GTIA are the heart of the Atari. Change one,
and you have a hybrid. Change them all,and you have a different
computer altogether.
By the way, by "change", I don't mean using a Translator disk, or
diddling with a few bits here and there. In the cae of the OS, I'm
talking about the sort of re-write recently discussed in this newsgroup
that would change the location of just about the entire OS (so that
new additions could be added). I remember someone else talking about
updating ANTIC so that a new CPU could be put in place, and this is
also anathema to me.
Essentially, if I want all the woderful new equipment, I'll flick
on my IBM clone. When I use the Atari, I use it for what it is.
I use a completely Atari-brand system, excepting only the 14.4Kbaud
modem (hooked up thru the 850 interface). The 850 allows easy
attachment of new printers and modems,and that is something I think
is fine...you're still using an Atari. Black box users are also
still using an Atari, even tho it is running from a HDD. The
peripherals don't matter...the computer does.
Keep in mind that I am not damning those who would do these things.
I just would not like to see what little 8-bit market there is shift
to serving such changeling Atari's.

If this still doesn't convince you, then I'll have to say that we just
have a different perspective, and there's no way to convince either
of us to change his mind. :)

Regards,

Joe

>
> And a nicer keyboard and a GTIA chip ...

Well, the GTIA came earlier than the 1200, but you're so right about
the keyboard -- too bad Atari didn't stick with it.

Also, the "incompatible" OS wasn't a huge hindrance -- it had a lot of
improvements over the 400/800 OSW, and if you REALLY needed the old OS
there was the translator disk (and many imitators).
I got my 1200xl in '83, and never had any compatibility problems until
one demo a decade later.

Or not enough......
Acceleration is simply the rate of change of velocity. Its sign has
nothing to do with the rate of change of speed (the magnitude of velocity).
Since velocity is a vector with specific direction, so is
acceleration. The acceleration is independent of the current velocity
of the object. If you define "Up" as the positive direction, then
acceleration in acceleration due to gravity is negative, no matter
what the instantaneous velocity of the object is.

I'm probably not explaining this well, but that's ok -- this isn't
sci.physics.

PAL C64 (europe) runs at 0.985...etc mHz but has a lot of rasters more to play with than NTSC C64 (usa) which I think is 1.02 mHz ??. The NTSC C64 gets 2 more cycles per raster but since the PAL C64 has like 70??? more rasters, it ends up with loads more cycles per frame. I'm not sure about any of this, though... time for the C64 gurus to correct any disinformation here :).

Mike

PS: I'd like similar stats for Apple IIE and 800xl plz... I have not much in the way of documentation for them. Oh, which 6502 did these machines use? CBM bought out Mostek (right?) and so they were producing their own 6510's, etc...Atari and Apple used ??? Rockwell 6502s ?

: Would you care to explain why a general purpose processor isn't able to
: multitask? :-) I'm sure it's very possible and not too hard either.

It can multitask within a given program, via interrupt routines, that's the way games work. But it just can't provide anything but a collossal kluge as far as providing truly separate areas for many programs to run from. The way Snapshot works is to task switch. The 6502 is designed to execute 1 program. It has 1 stack, 1 page 0, not many registers, etc...

The 6809 has enough registers to kluge a multitasking system by segmenting the memory up into a zillion parts.

> Any comments, mail to Masstorage@closer.brisnet.org.au .

rlI remember SuperDOS. I registered my copy many years ago. However, afte
rlI
rlmoved to SpartaDOS, I placed it in the box with all MyDOS, DOS3, DOS4,
rlDOSXL
rland a few others that I picked up along the way.

rlAbout the only thing that I would like to see would be a DOS that can
rlactually
rlread SpartaDOS's structure.

Why bother, Sparta can read and write dos 2 disks. SuperDOS is a replacement for dos 2/2.5 . It can be added to the AUX file If enough people ask for it. One thing I should point out here is that SuperDOS was never designed to do 16 meg. If it was to do that then i should call it mydos. It is a dos desgined for floppy disks only up to 360k xf551. Hey, i my self use sparta on my hard drive, but if I work with dos 2 disks then I use SuperDOS .

>What's Freddie?

BlFreddie was a Memory Manager that allowed the CPU to read from 'primary'
BlRAM while the video DMA happened from 'extended' RAM for the same
Blphysical addresses.

Not true. Freddy is a type of memory controller. It takes the address and clock from the cpu and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystall and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended ram. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16 pin chip (atari/best electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14 ,A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then goto freddy for the address range of the extra memory bank(or normal address range with no bank switching). The antic/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. A 800XL can look like a 130xe with that 16pin chip installed (Thats right NO freddy) and an extra 8 ram chips.

I may be committing a netiquette boo-boo here, but can someone help me
with the following questions??

1. What does a "modern" Atari 8-bit setup look like? What would be the major
soup-up peripherals currently available for 400/800/130/??
2. What's third-party support like for Atari 8-bits?

3. Hmmm, I just realized that an Atari FAQ file would get me all of this
info on a silver platter. Can someone direct me to an FTP Mail server?
(Not true FTP - I don't have that capability)

I have the following 8-bit hardware for sale. Prices do not include shipping.

- ATR 8000 w/64K and Co-Power 88 with 5.25" 1.2MB floppy $125
- Atari XEP-80 80-column adapter ..... $ 30

Please send inquiries via e-mail to ccastn1@prism.gatech.edu.

I saw some multitasking OS for the 8-bit on atari.archive.umich.edu. Don't know how good it is, but I'd have to agree that multi-tasking is mainly software (and having apps that run 'clean' to use under it).

6822. PC Xformer 2.00 and 2.50

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-30 07:07:08 UTC
From: ime@death.hancad.co.at
Message-ID: <3bh8as$drp@hancad.hancad.co.at>
Source record: 96900

I've tried V2.0 and V2.5 of PC Xformer and copied some Disks with SIO2PC to ATR Files.

These disks have a special COM-file loader on them, which loads the COM-files in Ultraspeed on an accelerated disk drive.

The loader sends the disk drive a special command and if the drive accepts it, it loads the high speed SIO code from that drive, otherwise it will use the ROM based (slow) SIO code.

Doesn't work on PC Xformer.

: Actually, SAM was written by my partner, Mark Barton. I worked on the
: synthesis kernel and got it to run in real time. Afterwards we co-wrote
: Apple's original MacinTalk, the Amiga's Narrator device, and our current,
: fifth-generation system which runs under Windows and OS/2.

There seems to be some confusion here. Both SAMS exist- the Software Automatic Mouth on the 8 bit Atari, and also a computer called the SAM Coupe', which could run ZX Spectrum software (the Spectrum had a *huge* software base in the UK, so this feature was quite important when the SAM was released), but was a vastly improved machine. The SAM coupe' wasn't, as far as I know, deisgned or sold by Sinclair. It didn't sell very well, although someone in my Computer Science class at school had one.

Message-ID: <199411301118.AA003804289@relay2.geis.com>
Source record: 96903

As I recall, the 6502 can do task splitting, not true multitasking. The MTOS program by Tom Hunt (Multi Tasking Operating System) would run up to 4 programs at once. Each had its own 16k bank; screen memory was mapped above the bank select area. Each task could have its own display being updated etc.

Byte, in the early 80's, had an article on this topic. They proposed a system with interrupt driven task switching. I suppose as long as the task manager used maskable interrupts it would be possible. But I think it would be of limited use on an 8-bit, 64k address space system. Much better in my opinion is a program like SnapShot, which lets you keep two 64k machines available by pressing HELP; I'm fiddling with keeping FlickerTerm and Kermit co-resident.

Atari's CPU is clocked at around 1.78Mhz. File access in Atari Basic isn't
all that slow in fact, unless you try to read/write a file one byte at a time,
then it is OBVIOUSLY going to be slow! The reason for this is the Atari's I/O
structure, which means that BASIC itself has very little work to do when
accessing a file. All the BASIC code has to do is set up the IOCB (Input
Output Control Blocks) and call the CIO (Central Input Output) routine. Atari
Basic's one draw back in this area is not having a read/write buffer
command (there is one in Turbo Basic though). The way around this is to set
up the IOCB yourself, which can be done in less than a dozen POKE's, and is
pretty easy to do (it was after all designed to be the user interface to the
I/O routines) once you know the addresses.

As an aside, did you know that Atari were originaly thinking of using Microsoft
Basic on the 400/800?

(Discussion of C=64 'Skate or Die' vs. great Atari demos.)
This type of comparision is sorta flaming. I never saw 'Skate or Die'
and the person saying Atari demos blow C=64 away probably hasn't
either. I have seen and played 'The Gladiator' demo for the C. I would
like to see 'Skate or Die'. 'The Gladiator' is really nice. The
graphics are cool, but the music is Fantastic. It is the reason why I
said SID is a better chip than the POKEY for sound. My favorite Atari
graphics demo is the sorta kaleidoscope thing from 'Compy Shop' that
plays 'House of the Rising Sun'. For sound, the mIRAGE.COM from Poland
I think is pretty nice.

You're both right.
The 65C02 was a later chip with an enhanced instruction set. It has
such useful instructions as STZ (Store Zero) and BRA (Branch Always),
which the 6502 doesn't have.

The 6502C was the version of the 6502 that the Atari used, which had
some extra logic circuits on board. To use a standard 6502 or 65C02
in any Atari except early 400/800s, you need to add this extra
circuitry.

Yes. I have the book "The Creative Atari", which essentially consists
of Atari articles from Creative Computing from around '79 or '80 to
the early-XL era. In some early articles it talks about the "New" GTIA,
and this is before the 1200 -- maybe even before Warner.
Weren't the 400/800s discontinued when the 1200xl came?
I know they were gone by the time the other XLs came.

Does anyone know anything about the configuration block readable on any Atari floppy except Atari's own 810 or 1050 (I.E., Indus, Rana, XF551, etc.) I read in an old Compute! that you can read the configuration block with a SIO 'N' command, and write it with an SIO 'O' command. I also read that the block is 12 bytes long. What are the parameters? Can this be used in a program to automatically detect a different disk density? If anybody could help me find a reference to using the configuration block, I'd really appreciate it.

Well, I've always believed that electricity + water = a bad idea. You
may end up burning your house down, or it may just blow a fuse, but it
certainly isn't wise...

YKYB posting too many articles today when your newsreader starts saying
"This may post to many machines. Are you sure? [yn]"... :)

Just a couple of notes: The clock speed was different between the
C64 & Atari, but because the Atari ANTIC chip is active about 1/3 of
the time processing speed is about equal. You can disable the display
on an Atari to take advantage of the faster clock, but for that kind
of number crunching you'd be better off with just about any other computer.
As far as basics go, Atari Basic was/is one of my favorites. The OS on
the Atari had everything built in [different screen modes, I/O to any
device, floating point math, ...] This left the 8k of Basic's ROM to handle
a lot of nice features. There were a number of what I consider errors in
judgement, for instance handling all numbers as floating point, but I still
think it's one of the best available for learning programing.

By parallel interface do you mean for running a printer? If that's what you need you should be able to find one for about $30-$40. There are also a number of hacks for adding a printer to the joystick ports if you are really short of cash but know how to solder. None of these hacks is supported by the operating system though so you have to run a seperate program to print anything.

In a previous article, rfunk@magnus.acs.ohio-state.edu (Rob Funk) says:

>Yes. I have the book "The Creative Atari", which essentially consists
>of Atari articles from Creative Computing from around '79 or '80 to
>the early-XL era. In some early articles it talks about the "New" GTIA,
>and this is before the 1200 -- maybe even before Warner.

The GTIA started appearing in the 400/800 around 1980-81, but they knew
what the spec's were going to be even before that. (GTIA is described in
De Re Atari, for example.)

I don't remember when Warner bought Atari at the moment, but it was before
the 400/800 came out in 1979.

>Weren't the 400/800s discontinued when the 1200xl came?
>I know they were gone by the time the other XLs came.

The 400/800/1200XL co-existed from 1982-1983, then were discontinued
together when the 600XL/800XL came out in 1983.

6842. Re: SIO2PC Question

Newsgroup: comp.sys.atari.8bit
Date: 1994-11-30 19:01:56 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <128672@cup.portal.com>
Source record: 96820

I've been fiddling with the design of SIO2PC *AGAIN*. It's a sure
invitation to get flamed, but after several people E-Mailed my with
questions similar to "What is a 4049?" I decided to switch IC's.
I just finished a design based on a 74LS00 which everybody on the
planet should be familiar with & also brings the price down a few
more cents. What I'm thinking of doing is maybe having a small run of
boards made. The down side of this is the minimum run will cost me $150
as I've had no luck with etching my own boards. It's funny because years
ago I used to be able to do this all the time, senile now? Anyway, if
enough people ask I'll go ahead and have some boards made up. I like
the SASE idea since I get about 6 months behind on projects that require
me to lick a stamp. I don't have a lot of Atari serial cables so I'd
really rather not do the soldering of cables etcetera. What I'm thinking
is if someone can show me a reciept for any Atari purchase, magazine
subscription, shareware registration, ??? & sends me a SASE I can send
them a board with parts list & instructions. At least that way I won't
be sitting here looking at a couple of dozen unused boards. Shareware
fee to Nick Kennedy would also certainly qualify. I can't see charging
more then a $1/board even if people don't have a recent Atari purchase
& a kit of parts sans cables should be $2-$3. I'd have to see if the
parts weigh less then an ounce.
Anyway, open invitation to nag me into action.
Rick

>|: the keyboard -- too bad Atari didn't stick with it.
>
>What was special about the 1200XL's keyboard? How did it differ from the
>other XL/XE models, or the 400/800s?

While the others had 4 or 5 "extra" keys (start, select, option,
reset, help) off to the right side, off the main keyboard, the 1200
had them all in a row along the top at a similar distance, making room
for more, including four special function keys (which weren't used in
any software, but had enough built-in functions to be useful).

But the best part of this arrangement is that it left room for the
inverse video key and the break key, separate from more commonly used
keys like backspace and shift. So the shift keys on the 1200 are
wider than on the others, and the backspace key is double width --
very important for fast but sloppy typers like me. On the 1200 I
don't accidentally hit break when I just want to backspace.

Even now, when I use PC-style keyboards, I prefer the ones with a
double-width backspace, although it's better to accidentally hit "\"
than Break.

Another excellent quality of the 1200xl's keyboard, which it shared
with the 800, was its tactile feel and durability. Starting with the
600xl/800xl, Atari gradually made their keyboards flimsier and more
"rubbery". I've seen many XLs and XEs with worn-out keyboards, but
I've never seen a worn-out 1200xl keyboard.

BTW, of the machines from that era, I consider Apple's keyboard
most similar in quality to the 1200xl, but I hate Commodore's and the
original PC's keyboard.

This is exactly what happened to commodore (and atari): the names
became associated with game machines.

>The Atari was a friendlier machine IMHO, it had a real bootable DOS with
>full disk utilities (none of this LOAD"$",8 stuff! <g>) and better
>expansion options.

That commodore format was a legacy from the old PET file system. On the
other hand, in the days of cassette drives, the PET had relatively
sophisticated file control, if memory serves. *everything* could be
opened--the serial port, etc. The PET used the iee-488 insturment
interface.

I'm assuming that the power supply is sealed in rubber, but this still
strikes me as a foolish idea. Water and 120 VAC are generally not a
good combo. WHat you could do, though, is to mount a nice big heat sink
if you can find a way to fasten it without screws, and use heat jelly.

>disinformation here :).

I'm not sure if the numbers are right or wrong, but they look about
right. It's the same situation with the Amiga - NTSC users get a
slightly faster CPU, but lose a whole mess of rasters - 70 sounds like a
fair number - and rasters are valuable. (The NTSC system is de Babylon,
dem be taking de rastas... :)

>PS: I'd like similar stats for Apple IIE and 800xl plz... I have not much

>use? CBM bought out Mostek (right?) and so they were producing their own
>6510's, etc...Atari and Apple used ??? Rockwell 6502s ?

The Atari had a plain vanilla 6502 - I think later models may have had a
6502C - I'll crack mine open later and have a look. I don't remember
there being a CPU/raster tradeoff on the Ataris, but I could be wrong.
(It has been known. :)

>use?

Apple II, II+, and IIe, 1Mhz 6502 1mhz
Apple III 6502 1mhz
PET 1MHZ 6502 1mhz
SYM, KYM 6502 1mhz
Ohio Scientific 6502 1-2mhz, but roughly doubled on top
of that; i forget how
TRS-80 (modlel 1,3) z80, 1.78 mhz (the same speed as
characters appeared on the screen,
but still yanked the video
circuitry out to access memory,
glitching the screen
Most S100 and CPM 8080 2mhz or
z80 4mhz (occasionally 2 or 2.5)
Atari 400/800 6502 1.8 mhz *but* shut down during
screen refresh for thye video
processor, netting about 1.0
give or take

SWTP 6800 1.0

that's most, but not all, of the early (popluar) machines

Oh, and how can i forget the 1802, around which I built my first
computer. It was typically used at 1-2 mhz by homebrewers, and
particularly at 3.579545/2 Mhz (colorburst crystal) if the 1861 video
chip was used. I belive that combo (they were rca chips) was used in
teh early rca tv's with on screen displays

You are speaking of MTOS. MTOS does not solve the problem of
memory allocation. You can only run tiny programs that will fit in main
memory. Snapshot lets you run any size program, but that is task SWITCHING.

Neither are full operating systems. They are patches.

The C64 had a much bigger market, as you say, and much more flexible sound.
This gave it an edge as a game machine in general, but some Atari games were
as good or better than their C64 equivalents. Ballblazer, for one.
However, towards the end, many C64 games just didn't appear for the Atari.

>Any flame-free feedback? Which made the better game machine, and
>what were your favorite games? (Archon! Archon! Archon!)

I vote for MULE. Played it first on a friend's 64, then on my 8bit Atari.
Loved it.

I have a very large collection of hardware, software, carts, & almost
every book every printed & almost every magazine printed about the Atari
8-bit computers. They've been sitting around for years now and I'm in
need of the room they occupy. If you want to buy anything, email me:
chard31@aol.com
I'm sure we can work something out. btw I'm on Long Island, NY.

chard31@aol.com 11-30-94

I know that CLEANUP will check the disk structure but I did not know that
it would defragment files as well. Is this the case?

With about 50 more posts on this subject ahead for me
to yet read, I hope this little tidbit is not premature.

Marketing is probably the "real" reason for Commodore's
ultimate superiority. Why? Does anyone recall why
Texas Instruments TI-99 computer was discontinued and
TI even called "Uncle" by withdrawing completely from
the home computer market?

The answer is/was "price wars".

With Atari and Commodore both duking it out in places
like Kmart, lowering the price of their respective machines
on an almost weekly basis, the poor little TI-99 never
had a chance! TI ended up actually selling the TI-99
for LESS than it cost for them to manufacture the thing!

I don't think Atari ever actually managed to beat
Commodore (Tramiel, remember?) when it came to reducing
the retail price. Owning their own chip factory helped
Commodore more than anything. That, and downright shoddy
production standards. Commodore's disk drives failed at
such a high rate, it was almost a 50/50 proposition for
some time whether the drive a consumer purchased didn't
have some sort of failure. Just how many revisions in
that thing were there? 5? 10? More?

Atari built hardware that was rugged to almost military
standards. Commodore built hardware that (for quite some
time) barely managed to rise above the quality given to
toys. To paraphrase "Field of Dreams":

"Build it cheap, and they will buy."

Compare the construction of the 400/800 computers (and the
TI-99 for that matter) with the construction of the first
Commodore VIC-20's and 64's and you will understand what I
mean.

Sadly, Jack Tramiel adhered to that same philosophy when he
bought Atari. Everything made by Atari since then reflects
this. Consumer "support" was/is nonexistant in comparison
to other manufacturers. Shoddy at best.

But - I still love my 400/800/130 XE computers and peripherals.
Comparing the construction of my own 400/800 computers with

that of my 800XL and 130XE is like comparing the solid, quality construction of a 1950's era auto with that of a modern Ford Escort. No comparison, really. While the technology within each incarnation is virtually identical, the later models leave a lot to be desired when it comes to using the word "quality" to judge them by. I've had to repair my XL/XE's many more times over than the original machines.

As far as which machine is the "truly superior" one is a matter of taste. Much like the question of which is better, Sega Genesis or Super Nintendo? It all evens out when the technology of one machine is compared over the other by things like the abilities of a given programmer. Frogger for the Atari computers was never equalled on another machine of its class. Why? The programmer. Archon on the 64 was superior to the Atari. Why? Again, the programmer. I own both Sega Genesis AND SNES. That way, I can purchase the superior version of a game that is written for both platforms. (That reason as well as for unique games like "Donkey Kong Country" or "Sonic") Yes, I have a Commodore 64 also. Why? Because it was cheap, and had titles that were not available on the Atari simultaneously.

In 1979, the Atari computers were the winners, hands down. By the time Commodore came along with the 64 a few years later, Atari had only itself (and Warner) to blame for it's market loss. After all, the two machines were almost identical. What else but poor marketing can explain the demise of the "Real McCoy"?

And that's my view. So what if I rambled?

Uncle Fester

6863. Hard Drive Optimizer

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-01 04:29:32 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2EDC96A1@POST0.LAAFB.AF.MIL>
Source record: 96842

CleanUp by ICD/FTe is not a hard drive optimizer. CleanUp, which only works with SpartaDOS 3.2 and up, only corrects errors between the File Access Table (FAT) bitmap and the actual directory structure. It also closes files left open for writing/reading and resolves any other internal conflicts. CleanUp basically corrects errors.

An Hard Drive Optimizer tries to make the sectors of a file contiguous so that the head on the hard drive doesn't skip all over the place when loading a file. After you delete and write a bunch of times on, a new file could be spread all over the hard drive. Sparta will write the first sector (or new subdirectory) in the first available empty sector and go from them. If you are adding entries to a subdirectory and the subdirectory goes beyond 256 bytes it will continue the subdirectory onto the next free sector after updating the pointer. After awhile the hard drive gets pretty jumbled.

Since the max hard drive partition is 16meg, it isn't clear to me whether this is a real problem, since there really isn't a "slow down" in performance since the partition is so small. Also, you really don't get any more space after optimization, since everything is written in complete 256 byte sectors. All you are doing with optimization is reordering the sectors, in essence.

The only real way to optimize your hard drive today is to do the following.

1. Put all the programs you use and don't change or erase in separate subdirectories.

2. Back up you hard drive with FlashBack from ICD/FTe.

3. Rewrite your Hard Drive from the FlashBack backup and make sure those subdirectories that have the programs you don't change or erase are the first ones written (first in the listing on the main directory).

FlashBack copies the actual files and not a disk image. In fact you FlashBack backups are optimized (made contiguous) when the back up is created. When you restore your drive using the FlashBack backup, the files will be written contiguously, because that's the algorithm Sparta uses--next available sector. Since you are in essence writing to a "blank" drive, when you do a restore, the next sector will be the contiguous one.

I've only done this once in 5 years and really haven't found it necessary (except after my major crash).

I don't know all of the details about multitasking, but I would think the 6502 would be ideal in many ways. It has very low interrupt latency, and very few registers required to be pushed in order to save the state of the CPU when switching tasks.

I would think that all other concerns would be primarily software in nature, and I can't think of anything that would seriously limit the 6502 for multitasking desing.

: Atari? Damark lists a Digital ink-jet printer for $149 (which is less
: than I paid for my dot-matrix printer). Other than the correct cable,
: is there any reason why this printer wouldn't work with my system?

With text I think it'll work fine. But make sure it has Epson FX emulation if you want to use daisy dot or othe grahics dump stuff. I know some Epsons (naturally) offer FX/MX emulation. Some others do too I believe.

However, it has been my experience that 24pin dot matrix printers actually look crisper than inkjets due to the bleeding problem which is a blight with inkjets. dpi is about the same between a 24 pin and an inkjet. 24 pins are just clearer in the way they lay down the ink.

The new 720x720 dpi Color Stylus, though, that combined with the right paper just might blow away the 24 pin dot matrix printers.

But despite the fact that inkjet is a newer tech than 24pin dotmatrix, it often looks worse, like I said....

If I'm correct, the Sally CPU used in the XL/XE-line is the 6502c which is
not pin-compatible with the R6502 or the R65C02. For pinouts of those
three CPU's, look at the Atari 8-Bit Home Page. Recently I added a new section
with pinouts of the 3 CPU's, ANTIC, GTIA, POKEY etc.etc.

<SNIP>

This isn't really about the 1541 or any other commodore disk drives, but it's about drives made by another manufacturer that all looked like the single floppys that you used to get with BBC micros in school (obviously in good old blighty only - or did they ever go to america??), the wonderful old 40-80 track ones (for the BBC, not c64).

What the hell were they called, 'cos I can't remember, though I had one for years (along with an Action Replay IV cart) and it never overheated or even got more than warm.

Anyhow, just thought I'd satisfy myself over your newsgroup.

I'd better go wipe the screen before the Admin guys come in with their night sticks and long white-sleeved jackets with buckles round the back.

There is an extension to the excellent QUICK programming language from PPP in Germany that allows Multitasking.

I don't know all that much about it, mainly because it is still in German language and as far as I know it has not been made available outside of Germany yet! Apparently each 'program' resides in one of the XE memory banks.

I don't know if its a true multi-tasking software product or just some clever programming, I don't even know if it works on a 64k machine. Anybody else know.... Over to you guys in Germany?

Is cartridge hard/software the only software that uses the 8-bit light pin.
That is, is there any software that uses a programming language to utilise a
light pen?? I was given an 8-bit light pen, and wondering about using it for
my STe. Any thoughts?
thanks/merci

Would the speed of the ST provide more accurate scanning. I realise that this
is an 8-bit group, but the reason I ask is because I have access to an 8bit
light pen, and was wondering if I could write something to use it on my STe.
Now the light pen comes with a cartridge, which I presume has the controlling
software, but that is of no use on an STe. Would you be able to recommend a
source(ie. book) for 8-bit programming for such stuff as light pens. Thanks
for any help.
Merci

You made some good points. There is nothing like the good old days.
I remember buying a lot of C64s and 1541 drives and having to return
them to get repaired. Only bought 1 Atari 800XL and 1050 disk drive
and they are still working today!

6876. Recursion in Action! This seems to do it! (STACKTST.ACT/.C/.BAS)

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-01 16:25:14 UTC
From: KENDRICK@sonoma.edu
Message-ID: <941201082534.20609528@sonoma.edu>
Source record: 96850

The following file is the C code I first came up with when I was thinking of how to go about adding a local-variable stack to Action! so that PROCedures and FUNCtions can be made to do recursion.

I tested it out in Think C++ on a Macintosh but didn't trust it since, well, C handles this by itself, so all I could be doing is wasting memory! But never fear, two files follow this:

```
-----------------begin-stacktst.c----------------------
/* StackTst.c: Stack Test program for adding recursion to Action! */

#include "stdio.h"

int sp;
int stack[1024];

void overflow()
{
printf("Overflow\n");
}

void underflow()
{
printf("Underflow\n");
}

void init()
{
sp=0;
}

void push(int x)
{
stack[sp]=x;
sp=sp+1;

}

/* By Bill Kendrick 11/29/1994 */ /* See STACKTST.ACT... */

-----------end----------
```

Well, since I didn't trust it, I started writing another text program in QBASIC on an IBM. Of course, at first I started out writing the thing with "SUBS" and "FUNCTIONS"! Duh! QBASIC probably uses a stack for local variables too! So I started over and just used GOSUBS and passed variables to my GOSUB'd functions via "x" and "n" variables. The code looks much more drawn out than it needs to be in a higher level language, but for you Atari BASIC and TurboBASIC XL users, you may find this useful nonetheless. BTW: This seems to work too! :)

```
----------begin-stacktst.bas-------
1 ' StackTst.Bas
2 ' by Bill Kendrick 11/29/1994
3 ' Test of StackTst.c code in (Q)BASIC without using real
4 ' FUNCs.

5 DIM stack(100)
6 GOTO 1000

10 ' push
11 stack(sp) = x
12 sp = sp + 1
13 RETURN
```

```
20 ' pop
21 sp = sp - 1
22 x = stack(sp)
23 RETURN

100 ' factorial
101 IF n <= 1 THEN
102 m = 1
103 ELSE
104 x = n ' \ push(n)
105 GOSUB 10 ' /
106 n = n - 1 ' \
107 GOSUB 100 ' > m=factorial(n-1)
108 m = x ' /
109 GOSUB 20 ' \ m=pop()
110 n = x ' /
111 m = m * n
112 END IF
113 x = m ' return(x)
114 RETURN

1000 ' main
1001 n = 6 ' \
1002 GOSUB 100 ' > print factorial(6)
1003 PRINT x ' /
1004 END

----------end----------
```

Finally, after this last sucessful trial, I came up with the following Action! code, based on the C code above. I ran it, got "720" as a result (6!=720), screamed and jumped up and down; proceeded to tell the person on the other line what had just happened (giving her a breif description of recursion and factorial), then apologized and asked her to repeat what she was saying a moment before. <grin> ANYWAYS, I hadn't booted any DOS with the thing and was planning on using SIO2PC's Print-Thru and Atari's built in P:rinter device to make a copy of the thing as a file on my PC, but accidentally hit "D" for DOS instead of "E" for editor in Action!'s monitor and poof it was gone and I was enjoying the OS's Self-Test menu <sigh>. The following is obviously not my ORIGINAL code <grin>, AND IS NOT IDENTICAL to the C code! This gives you a menu letting you chose between FACTORIAL, FIBONACCI, and ACKERMANN recursive functions. ACKERMANN has not been tested, and when doing FACTORIAL and FIBONACCI, remember that I used INTs, so when it calculates values over 32767 or below -32768, the variable will have over-/under-flowed and answers will be wrong, but hell, at least it works for INTs! :)

Final notes: With the C code, you are restricted (unless you can get C to ignore type mismatches) to using INTs (or whatever you make your stack out of); oh, wait, perhaps I'm wrong. It has been a while. Well, anyways, don't TRUST any code you make using that (why would you use the C one is beyond me <grin>) until you have TESTED it thoroughly. In BASIC, you should be restricted to "reals"/"floats"/whatever you want to call them. This of course includes INTs because BASIC handles conversion to/from for you (this is in QBASIC; Atari BASIC / TurboBASIC XL don't actually have any other type other than INTs). In Action!, CARD is the largest type (2-bytes) and everything else is as big or smaller (INT=2 bytes, addresses=2 bytes, BYTEs=1 byte, CHARs=1 byte, POINTERs=2 bytes, etc.). Be warned not to try to do recursion with CHAR ARRAYs (strings) or any other type of array, or with records without being careful, and perhaps rewriting some of the PUSH/POP code. Also, I'm sure you could do something like this as well:

```
PROC PUSH(BYTE many, CARD a1,a2,a3,a4,a5,a6) ; I think Action! handles
; only 8 params max.
...

PROC POP(BYTE many, CARD POINTER a1,a2,a3,a4,a5,a6) ; not FUNC any more
```

to pass more than one value at a time to/from the stack.

Well, that's it! Have fun! Has anyone found an easier/better way to do recursion in Action! !?

Later!

>believe.

My new Canon BJC-4000 uses Epson emulation as the default, with
Proprinter a second choice -- definitely an advcantage over HP's PCL
printers. Graphics look wonderful. (Now if we could find a color
printing program for the Atari...)

>However, it has been my experience that 24pin dot matrix printers
>actually look crisper than inkjets due to the bleeding problem which is a
>blight with inkjets. dpi is about the same between a 24 pin and an
>inkjet. 24 pins are just clearer in the way they lay down the ink.

I don't have much experience with 24-pin printers, but don't they have
to make two passes for 360 dpi? Inkjets such as Canon's and Epson's
can do it in one pass, and they're much faster than most 24-pins, even
in the 24-pin's 180dpi mode. (My Canon is rated at 496cps draft,
which looks much better than any dot-matrix's LQ mode.)
I haven't had much bleeding problem. It's not quite as sharp as
laser, but much sharper than any dot-matrix results I've seen.
Dot-matrix has all those individual well-defined dots that you can see
so well.

>The new 720x720 dpi Color Stylus, though, that combined with the right
>paper just might blow away the 24 pin dot matrix printers.

Except that the only Atari programs I know of that can print color
expect you to print each color separately.

>But despite the fact that inkjet is a newer tech than 24pin dotmatrix, it
>often looks worse, like I said....

Depends on the ink and the paper. It often looks worse, but in my
experience it looks better more often.

Assuming the two you're referring to are the Commodore and PC....
I dislike them for different reasons. I hate both layouts (what was
that silly Restore key doing where my fingers expected Return? :-),
and I hate both clackiness and mushiness. Atari and Apple had firm
but quiet keyboards -- you press the key until it hits bottom, and
you get a character on screen, without hearing all about it.

Both Atari and Apple keyboads had their flaws, of course. Atari had a
weird layout, but since that was the first one I spent a lot of time
on, I got used to it easily. Atari tried to make up for the quiet
keyboard with the speaker keyclick; the best thing about the 1200xl is
that you can turn off that click with Ctrl-F3.

Apple didn't get things quite right until the IIe; I'm amazed that the
early Apples couldn't even do lower case (or tabs?).

Hmmm... this has not been my experience. It's true that inkjet output
will bleed to some extent and look downright 'fuzzy' if you use the
wrong kind of paper. Paper that has too high a rag content will tend
to bleed but using a quality paper with a somewhat smooth texture
(such as Hammermill Laser Bond) should produce near-laser quality
output that should pass the toughest scrutiny for home use.

Still, it's mighty tough to get an inkjet or laser printer to do a good
job on multi-part forms. :)

Stock Market (*)
Atari Speed Reading (Cassette) (@)
AtariWriter (Cartridge) (#)

Software without boxes and docs:

PacMan (Cartridge) (*)
PacMan (Cartridge) (*)
Antic Disks (3) All three for $7+S/H
Star Raiders (Cartridge) (*)
CheckMate (#)
Jaw Breaker (*)
World Championship Karate (*)
HomeCard (#)

Software with boxes and docs:

Zork I (*)
Zork II (*)
VisiCalc (#)
Crusade in Europe (*)
Nato Commander (*)
Conflict in Vietnam (*)
Top Gunner Collection (*)

Spy vs. Spy (*)
Decision in the Desert (*)
Peggammon (*)
F-15 Strike Eagle (*)
BallBlazer (*)
Kennedy Approach (*)
Puzzle Panic (*)
Ace of Aces (*)
Reforger (*)
Fight Night (*)
Blue Team Bridge (*)
Archon (*)
Hardball (*)
One on One (*)
Eastern Front (*)
Mickey in the Great Outdoors (Cassette) (#)
Interlisp/65 (^)
Financial CookBook (#)
Combat Leader (*)
Home Filing Manager (#)
AtariWriter (#)

Books:

How to Program the Atari in 6502 Machine Language
Atari Roots
Atari Basic
Compute's First Book of Atari Graphics
Compute's First Book of Atari
Mapping the Atari

Hardware:

1050 Disk Drive w/PS and Cable
800xl w/PS and Cables
800xl no PS and Cables
1027 Printer w/PS and Cable
Supra 300 Baud Modem w/PS,Cable and Software
Koala Pad w/Cable and Software

Parts:

ch> Rockwell!).

To my knowledge, Mostek should not have anything to do with the 6502,
at least it didn't design it. The company that designed the 6502 was
called MOS Technologies. Later it became CSG (Commodore Semiconductor
Group), and now it has or has not gone out of business. (Most divisions
of Commodore are out of business now, but there are some rumours that
some company would buy what is left from Commodore.)

But when it comes to the NMOS 65xx series, as designed by MOS
Technologies, there is a very complete documentation of it on my WWW
pages. Its URL is http://www.hut.fi/~msmakela/emul/x64-64doc.html.
Also, I have some information on the Commodore 64 emulators too,
http://www.hut.fi/~msmakela/emul/.

> my PC's hardrive. How would I transfer them to the PC Xformer
> drives?

You can get the freeware version of PC Xformer from the Atari forums on Compuserve, or you can ftp it from the Umich archives.

The site's name is: archive.umich.edu (also try mirror.archive.umich.edu)
The file's path is: atari/8bit/Xf2/xf25.zip (approx. 180k ZIPped)

Getting your 8-bit files to the PC is the hard part. If they are already there, they can easily be put on PC Xformer virtual drives. A virtual drive is just a file with the same number of bytes as the Atari disk has. When you start PC Xformer, you put the names of the virtual disks that you want to use on the command line. You can also specify a file, and it will be treated like a virtual disk containing that file. For example, to copy "mule" on to a virtual disk, you would start the program like this: "xf25 vdisk mule", assuming vdisk is a formated disk with dos on it. Then you can copy mule from d2 to d1. The program docs explain all this in more detail.

...

Where I grew up (Orem, Utah), a large number of my friends had Atari 8-bit computers, while only 1 of them had Commodore (that I knew of anyway.)
Maybe my Atari-ness (I got one in about 1982--a 400, 16K RAM, no tape (yet), etc.) precluded me from meeting other local Commodore owners; I don't know.
I'm glad I went the Atari route (though at the time I was hoping to receive a TI 99/4A (I was young and foolish)), because I know what I can do with it and I have gained complete control over its capabilities, and I appreciate its elegance, even though it is "behind the times."
I'll probably keep my Ataris forever.

Actaully, beleive it or not, multitasking HAS been done on the 8-bit with
a program called GENIE. You load the program, then insert the other
software you want to run(like Daisy Dot, as a good example) and press
SELECT. It has a calculator, word processor and a few other goodies on it.
The word processor is especially good for Daisy Dot so that you don't have
to constantly switch back and forth between editor and Daisy Dot while
discovering errors in your typing. Instead, you just press SHIFt+CNTRL+ESC
and you go into te GENIE menu where you can edit your file and go back
again the same way you got in, and print your file. If this was a DOS
based system, I might have uploaded it a long time ago...oh well.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

nthewarapp@ea.com (Neil Thewarapperuma) wrote:

Jeff has solved the problem!

The problem seems to have been an incompatibility with my "Hyper Drive" (a
Happy clone) enhancement for my 1050 - which is weird because I've had no
incompatibility problems in the past, even with heavily copy-protected
commercial software.

I followed Jeff's advice and formatted 3.5" disks in the 720k drive as if
they were Single, Mid, and Double-Density 5.25" disks in DiskCommunicator
and it worked!

So I'm now using my 720k drive like it was a 1050 just for .DCM files due
to the Hyper Drive incompatibility, but it works!
Also, when I do a sector copy of un-.DCM'd 3.5" disks back to the 1050,
that works too, so it's just an incompatibility between the Hyper Drive
and DiskCommunicator.

Thanks to everyone else for their suggestions!

I wish I knew WHERE people got this "moisture and electronics" bunk from ...

I once had an argument with Bruce Hammond (then President of Starpoint Software) about computers & water ... So, we took a KIM-1 and a baking dish. Filled the baking dish with plain-old tap-water, which was VERY heavy in mineral content, and used four corks to support the KIM from the bottom of the pan.

Toggled in a little program to do a display hack and set it into the water. Continued to run. Allowed it to run this way for about 20 hours.

Next day, we experimented with: Diet Pepsi (which is how the entire argument started), no ill effects. Coffee (black) .. no ill effects. Coffee (cream & Sugar) finally crashed.

I wish I had a nickel for every person who said, "My PC keyboard is acting flaky, what should I do?" My stock answer is always, "Take it all apart, and run the circuit board inside through the dishwasher." The Luser invariably replies "Dishwasher! But water is BAD for electronics!"

sigh Misinformation abounds.

: : Hardware tricks of the Atari. As long as games were designed for the
: : 64, the Atari versions tended to suffer.

: Actually, Ball Blazer was written specifically for the 7800, but
: got ported over when the 7800 was delayed.

Wait, the 7800 version of BallBlaster... ported to the computer?
Dunno bout that.. I don't think the idea of using a pokey chip would have
come up unless it was already used in a version.

7800BB by the way is pretty DAMN SHARP! I have the 8bit BallBlaster (
smugled out pre-release?)... the logic of the face off on the computer
is better than the 7800, but the 7800 is much smoother and more responsive.

Was this ever an arcade game? I swear I remember seeing a Coin-op version
contest when this game was released.

: Well..how do you think windows works? =)

I believe memory segmenting is a function of the CPU, and is not completely software driven. The 286, I think, was the first machine to offer a more linear addressing scheme, but the older 8088ness is still there, which is used today for DOS/Windows.

It is easier to manage memory banks with the 8088 than it is to manage extended banks on an expanded Atari.

Same thing with the 6809. It has the registers to spare to be slaved into storing info on the banks for managing the swapping internally in the CPU and not building some monstrous engine externally.

Cleanup does not defrag. The only way to defrag is to backup and then restore onto a freshly formatted partition.

That was high on the list for the new SDX which has suspiciously disappeared into the ether over the last 12 months.

When I think of what I'd REALLY look forward to with the 8-bit, an updated SDX is #1. One that will read/write MYDOS partitions and therefore be the sum of MYDOS and Sparta.

: : Well..how do you think windows works? =)

: I believe memory segmenting is a function of the CPU, and is not
: completely software driven. The 286, I think, was the first machine to
: offer a more linear addressing scheme, but the older 8088ness is still
: there, which is used today for DOS/Windows.

It is a mixture of both. Unix on a PC uses the special modes of a
386/486/586 to achieve such things. However, the CPU in these cases
can not do it all by itself. There are just way too many processes running
. Also, a true multi-tasking CPU is very expensive. They do exist.
However, multi-tasking on CPU's that can't execute more than 1 command
at a time is possible via the OS. Its even been done very well with multiple
processors. (I don't have any of my OS or CPU design books with me
this semester so I can't give you a "good" answer as to how each does
multi-tasking.)

However, what would happen if we could slap another 6502C into an 8bit...
run both at once.. and communicate with one another...

The mind boggles.

As for redesigning ANTIC and GTIA... ahahaha The "templates" for the
chips probably aren't even on anything resembling "MAGIC" or the other
various VLSI programs. I spent 16 weeks of my college life building
a CPU using VLSI technology. It ain't easy.. but it can be rather fun!

However, if someone were to build a device that allowed an 80 column
mode..and it just plugged right in... I'd buy it. Hell, I would even
modify AW+ etc to use it if given the sources. =) As long as
it wasn't another "lets hang it off the controller ports" project.
An 80 column PBI device might be nice.. but that still kind of defeats
the purpose of the whole thing. And you would have major compatability
problems with MIO's and BB's. I wonder how atari's 1090 80 column card
was going to do it.

Hmm... ANTIC with an 80 column mode. That sounds nice. Too bad there
isnt a way to do a 40x48 character mode and have a chip combine every
2 lines into 1. Sick way of doing it...

Just how many software problems do you have with protected software?

I would think a very nice parallel floppy device (outside the Black Box)
would be very usefull. I imagine pulling the mechs out of my 1050's
and plugging them into a mini hd case and plugging them into a little
board that plugs into the PBI. The closest I ever got to a parallel
1050 was Mr. Wooleys (sp?) P1050 hack. Fast...but a major pain to build.

: Bill

Yes. You need a cart copier program. And not all carts will work...
you also have to bump the video memory up before loading the carts...
or is it down? I do forget....

I have an 800 set aside just for this purpose since dumping carts
on the 800 is the easiest. Only ever a few lockups. Of course I could
do it on an XL/XE with a translator running etc..etc... but...

Could anyone tell me what the difference between the original Star Raiders cartridge and the one that Atari put out when it tried to market the XE as a game machine is? I think it may have been called Star Raiders II.

I don't know about that, however I did know of someone who use to cool down his p/s by grabbing an extra box of MCCain (sp?) box drinks from the fridge and placed it on top of the p/s whenever he was thirsty. I figure 1 of these he'll finally short out something, but as of yet, his 64 is still functioinng fine!!!

Source record: 96656

Hello Atari users,

I've just picked up (dead cheap) an 800XL and 1050 disc drive at a flea market here in Stuttgart, Germany. I bought them just for fun and because I'm kind of interested in the machines of the 80's home computer boom.

The thing is, they came without PSU's, software or cables. Power is no problem: I read the faq and (I think) have them running OK - the 800XL computes and runs BASIC, the 1050 lights up and shunts the heads about 1/4" towards the centre when you switch it on. I hard-wired the peripheral sockets on the 2 boxes together, and now switching on the computer produces a beep and "BOOT ERROR" message which takes longer if you shut the drive door.

Am I right in thinking that it needs a DOS disc to boot from? Where can I find something that'll do the job? Also, the cartridge slot: I read an ancient book that said it was compatible with "all Atari software". Does this mean fun things like VCS cartridges?

Thanks for any help. I'd love to get the machine doing something useful, even if it's just Pac-man....

Ian

6914. Atari memory map?

Newsgroup: comp.sys.atari.8bit

>As an aside, did you know that Atari were originaly thinking of using Microsoft
>Basic on the 400/800?

Microsoft Basic was available for the 8-bits. It came on a floppy, and needed
32K of memory, as opposed to standard Atari Basic which (depending on your
computer) either came in a cartridge or was built in to the ROMs. It needed
8K of memory, if I remember properly.

An early example of Microsoft software being slower to load and taking four
times the memory of the competition.

(Actually, I preferred Basic XE by OSS...fully backwards-compatible to Atari
Basic, but had arrays of strings, While...Endwhile loops, If...Then...
Else...Endif constructs, built-in support for Player-Missile graphics,
procedure and function calls, and a semi-compiled "Fast" mode where it would

precompute the target locations of each goto, gosub, etc. Second-best Basic
I ever worked with.)

I had one of the first HP DeskJets and then an HP DeskJet Plus, which the 500 model replaced. A darn fine little printer, IMHO. Excellent output (on the proper paper), very quiet operation, and a lot less expensive than a laser although a bit slow sometimes.

Be advised it does NOT emulate an Epson printer, however. It supports the HP PGL opcodes and will require an HP DeskJet driver (many LaserJet drivers also work). You can purchase an Epson emulation cartridge for it that will make it think its an Epson FX-80, however. I used one of these for some time and it worked great.

I personally found these to be a good improvement over the c64, but
still far from ideal. They worked okay for programming, but I tended
to lose keys occasionally when doing word processing. My biggest
complaint was that the numeric key pad isn't recognized in 64 mode.
I had built a numeric keypad into my old c64 and rather liked it.

Just my 2 cents....

I've noticed that different XL keyboards have different feels - I've got 2 800XLs (only one which works right now). The older one has a much more robust keyboard, that feels ALMOST as good as my 800. The more recent one has a poor keyboard, but it's still light years ahead of the XE keyboards. Is there any easy way to hook a 1200xl keyboard onto a 130xe or even an 800xl? I've got a spare 1200xl keyboard, and would like to put it to use.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <128797@cup.portal.com>
Source record: 96798

I believe Bill Wilkinson did 2 articles on the subject, the first
one is from the Sept 1985 Compute. I don't have the 2nd article
handy, but I'd assume it's the next issue.
$.02, one of the problems with density detection is who is responsible
for it. For example, whenever you put a new disk into a 1050 you'll
notice the drive busy light spins for a few seconds. This is just the
drive figuring out what kind of disk has been inserted. Do the same thing
with a XF551 & nothing happens, it waits until you give it a cmd & then
figures things out. I believe ATR8000 just check the disk RPM at boot up
& infer drive type from that, from there on out, they do it the XF551 way.
Another problem is you can send/recieve info from the drive that is
completely meaningless. An example of this is Head Step Rate. Most
configurable drives I've seen will let you set it to ANYTHING! They don't
use it of course, but I guess they put it there for software that writes
out a drive configuration then reads it back in to see if it worked.
Since some drives do not automatically set their density when you insert
a disk IMO: It would be best to try performing an operation such as reading
a sector or directory before asking for the drive configuration. Let me
know what language you want it in & I can give you an example if you wish.
Rick

6924. MASSIVE AUCTION V -- update #5 (includes 130XE w/disk drive)

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

SUPER VIDEO ARCADE (SEAR INTELLIVISION SYSTEM), WITH TWO (2) DETACHABLE CONTROLLERS, AND RCA CABLE. SYSTEM ALSO COMES WITH FOUR (4) GAMES [ACCESSORIES FOR GAMES AS FOLLOWS]:

BURGERTIME (WITH 2 OVERLAYS)
LAS VEGAS POKER & BLACKJACK (COMPLETE: BOX, MANUAL, AND 2 OVERLAYS)
NFL FOOTBALL (WITH MANUAL, 1 PLAYBOOK, AND 2 OVERLAYS)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)

POWER SUPPLY IS BUILT IN.

MINIMUM OPENING BID OF $40.00

*****

LOT #15

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION SYSTEM WITH TWO (2) BUILT IN CONTROLLERS, AND RCA CABLE.
SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTROSMASH
BURGERTIME
LAS VEGAS POKER & BLACKJACK
LOCK 'N' CHASE
NFL FOOTBALL
SNAFU
SPACE BATTLE

POWER SUPPLY IS BUILT IN.

$40.00 precsys

*****

LOT #16 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION II SYSTEM WITH TWO (2) DETACHABLE CONTROLLERS, RCA CABLE, AND
ORIGINAL POWER SUPPLY. SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, OR
MANUALS FOR GAMES]:

LAS VEGAS POKER & BLACKJACK
NIGHT STALKER
SNAFU
SPACE ARMADA
SPACE HAWK
STAR STRIKE
TRIPLE ACTION

BID #1) MINIMUM OPENING BID OF $60.00
BID #2) MINIMUM OPENING BID OF $60.00

*****

LOT #17

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE, WITH ORIGINAL BOX, AND
THREE (3) INTELLIVOICE GAMES [ACCESSORIES FOR GAMES AS FOLLOWS]:

B-17 BOMBER (WITH BOX)
BOMB SQUAD (COMPLETE: BOX, MANUAL, AND 2 OVERLAYS)
SPACE SPARTANS (WITH BOX, MANUAL, AND 1 OVERLAY)

MINIMUM OPENING BID OF $30.00

*****

LOT #18

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE, WITH TWO (2) INTELLIVOICE
GAMES [NO BOXES, OR MANUALS FOR GAMES]:

BOMB SQUAD
SPACE SPARTANS

MINIMUM OPENING BID OF $20.00

*****

LOT #19 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ODYSSEY2 SYSTEM WITH ORIGINAL POWER SUPPLY, AND NINE (9) CARTRIDGES [NO BOX OR MANUAL FOR GAMES]:

SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!
ALIEN INVADERS -- PLUS!
BASEBALL!
BOWLING! / BASKETBALL!
FOOTBALL!
K.C. MUNCHKIN!
PICK AXE PETE!
POCKET BILLIARDS!
UFO!

BID #1) $45.00 YOUNGDT
BID #2) MINIMUM OPENING BID OF $45.00

*****

LOT #20

NEW RF SWITCHBOX PURCHASE OPTION

ODYSSEY2 SYSTEM WITH A *NEW* POWER SUPPLY, AND NINE CARTRIDGES (9) [FOUR WITH BOX, THE REST WITHOUT BOX OR MANUAL FOR GAMES]:

SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!
BASEBALL!
BOWLING! / BASKETBALL!
K.C. MUNCHKIN!
MATH-A-MAGIC! / ECHO!
ALIEN INVADERS -- PLUS! (WITH BOX)
BLOCKOUT! / BREAKDOWN! (WITH BOX)
FOOTBALL! (WITH BOX)
POCKET BILLIARDS! (WITH BOX)

THIS SYSTEM IS MISSING THE LITTLE BLACK KNOB OFF THE TOP OF BOTH JOYSTICK CONTROLLERS, OTHERWISE EVERYTHING WORKS.

6925. SuperDOS

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-02 18:31:21 UTC
From: b.poehland@genie.geis.com
Message-ID: <199412021831.AA229153075@relay2.geis.com>
Source record: 96797

I just recently obtained a copy of SuperDOS from my usergroup. This DOS has something unusual about it. When you format a disk with SuperDOS, you can boot the disk in a Percom drive with the timing hole covered. You can't do that with AtariDOS or SpartaDOS. I hope I'll have time to look at the situation a bit more closely. Most curious. OHAUG uses this DOS to format their disk newsletter & it boots in any brand of drive whether the drive needs timing holes or not. They didn't plan it that way, they just lucked out. I advised them to keep on doing it that way.

A code block is much easier IMHO. All you have to do is test if the
PROC is calling itself then clear the stack. I don't think I have
the code handy so watch out for typo's, but something like:
PROC Recurs()
BYTE flag=[0]
IF flag<>0
THEN [104 104] FI
;whatever you want to do
;assume you've figured out 'done'
IF done<>TRUE
THEN flag=1
Recurs()
ELSE flag=0
RETURN
FI
;A gratuitious RETURN could be added here, but
;it wouldn't ever be reached
```

Yes, several, but we're still kind of tight around here when anything close to piracy gets mentioned. Most of us know people that are some of the few remaining vendors left in Atari Land. I'm guessing you just want to have a few carts you own turned to files for your own use right? If so, we can take it to E-mail & I can give you some advice. It would work best if you have a real 800 to work with or at least a friend with an EPROM burner.
Rick

As I recall from chemistry classes, it's the concentration of ions in
a liquid that determines its conductivity. I'm surprised you had no
problems with tap water, but I wouldn't expect any problems with
distilled water.

And of course shorts won't cause any problems if there's no current to
short out (as in your dishwasher example).

6929. 32k carts?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-02 19:18:46 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Dec02.141618.19235@wariat.UUCP>
Source record: 96706

How can a cartridge have 32k? Or is it just some require 32k? The
American Technavision catalog has GATO carts for $12.50(I think) and
says it works on any machine but the 16k 400 and 600xl. I know some
carts can use 16k from $8000 to $BFFF, but 32k? And some carts use the
RAM under the cart. Is that how you get 32k? By using both ROM from
$8000-$BFFF and RAM from $8000-$BFFF?

If it emulates the epson, it must have the extra cartridge -- the
stock HPs don't do Epson.
They're not bad printers, but I like the Canon inkjets
better. If resolution matters to you, the HP is 300 dpi while Canon
and Epsons do 360.

>
>
> Well..how do you think windows works? =)

1 - Windows uses cooperative multitasking; programs give up control
when they are waitng for user input, and if they don't give up control
everything else stops.

2 - If you've ever had a General Protection Fault in Windows, you may
know that its memory allocation isn't bulletproof. When a buggy
program causes a GPF, it has been able to stomp on a part of memory it
isn't supposed to. This could easily corrupt other programs.
Windows 95 and OS/2 correct this by running in the 80x86's protected
mode, which of course the 6502 doesn't have.

Darek, did I get all that right? :-)

I'd be willing to attempt (or contribute to an attempt) to write a
true multitasking OS for the 6502 (or just the Atari) as an exercise
to see if it could be done. I can guarntee that it wouldn't be
compatible with much of the the existing software, though.

We probably couldn't get our hands on the templates anyway.
Anybody wanna reverse-engineer ANTIC? :-)

> Hmm... ANTIC with an 80 column mode. That sounds nice.

Oooh.... I *like* that idea.
Would it be possible to come up with a circuit that adds capabilities
to ANTIC somehow? That is, make a new circuit look to the software
like a part of ANTIC.

The ti wasn't exactly an 8 bit, though. It's processor ran a subset of
the LSI-11 set (PDP-11), and was at least nominally 16 bits, with a
32768 word address space.

Anyway, ti pretty much was giving the think away by the time they were
done, so they could sell cartridges, disk drives, & whathave yous.

By then, they'd gotten rid of that stupid keybord (no ; key, so your
fingers drifted, making it nearly impossible to type), plus that silly
idea that rom was cheaper than ram, and giving it soemthing lke a 16k
ram limit.

There are two 65C02 implementations. Western Design Center (the people who
designed the 'C02) designed both it and the 65C816 in a short period. When
the C02 was being sold as a core, Rockwell decided to add a few bit
manipulation instructions. WDC said, fine, but the instructions will NOT
be on the 816. So, the Rockwell 02 has 4 or so opcodes not found on either
the 02 or the 816. BTW, all other opcodes on the 02 are in the 816.

6937. FTe Guys: MIO Question

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-02 21:05:17 UTC
From: robg@picasso.ICSI.Net
Message-ID: <3bo26d$1m@picasso.ICSI.Net>
Source record: 96714

I have a 256K MIO that has developed a problem since I moved... whenever a cartridge is in my stock 800XL (Basic XE, Action, Mac/65, etc), the machine will reset into Self Test whenever I exit the MIO page with the '0' key.

I've tried it on two 800XL's (one stock, one with a Newell 256K upgrade), and the results are the same. However, if there is no cartridge, it works fine. The built-in basic does not cause the problem.

Any idea what's wrong and how I can fix it?

Thanks!

Rob

The way I heard it (from a former T.I. employee) was that some engineer
decided not to connect the last address line because "nobody is going to
need that much memory."

How... DOS-esque!

Well, I guess we will have to either wait or give up. I remember seeing a couple of people talking about a SDX defragmenter a year ago on the ICD BBS. I figured they would be out by now. Oh well.

That's just task-switching, not multitasking, and it's not the only
program that does it.
In multitasking, multiple programs are *running* at the same time,
while in task-switching only one is running at a time.
Think of multitasking (on a single-processor machine) as very fast
automated task-switching. The OS switches between programs fast
enough that it seems like they're all doing their own thing
simultaneously.

: precompute the target locations of each goto, gosub, etc. Second-best Basic
: I ever worked with.)

Basic XL takes up no more room than 8K AtariBasic because its routines
are stored in banked ROM. That's the way to do it on an 8-bit machine.
Basic XE is mostly the same, except that if you don't load the extensions
(which do eat up a bit of RAM) then you don't get the FAST command which
is stock to BXL. BXL has an extension disk which adds stuff like
procedures and other BXEish commands, but at the cost of memory.

BXE is the only language I know of that takes advantage of banked RAM for
program space. I don't know if any other 8-bit machines had anything
like it. BXL is a really nice language, and if Atari were smart they
would have bought the rights to it and thrown it into their XL/XEs as
AtariBasic.

: Tramiel's fault at all.

Well, there is a fine line between first run quirks, and recall-level problems. Personally I feel the hissing problem to be recall-level in magnitude yet these machines are still commonplace. I got one at ToysRUs and was flabbergasted that at this late date these things are still kicking around.

There are also reports of bugs in some of the games coming out right now, because they are rushing it and QC is the lowest thing on their priority list.

I'd be the first to congratulate you if you could pull it off. What it has to be able to do, is be able to multitask programs larger than just 16K chunks. That's gonna be slow if it will work at all because it can't bank 64K at a time. However, a cooperative multitask system might be more efficient. Task switching by itself, of course, has been done with good results with Snapshot.

To be truly useful, also tackling banked RAM handlers would be useful, ala the 8088 stuff. In other words, providing a BXEish automaice code splitter so you could break the 64K barrier.

If you do try this, talk to Tom Hunt first about it because he's spent a lot of time working on this.

: says it works on any machine but the 16k 400 and 600xl. I know some
: carts can use 16k from $8000 to $BFFF, but 32k? And some carts use the
: RAM under the cart. Is that how you get 32k? By using both ROM from
: $8000-$BFFF and RAM from $8000-$BFFF?

The cart port is more versatile than what Mapping the Atari says. Take something like Sparta X. That is a 64K banked ROM cart. Carts can probably run from ROM, or simply load themselves into memory like an ultra fast storage medium. Most game carts were written to run mostly from ROM. That's why something like Rescue on Fractalus, which is a 32K game, can run on a 400 w/16K RAM.

If you run a game mostly rom ROM directly, then I believe you only get 16K linearly.

The cart port can also be called to duty as a parallel bus replacement (Multiplexer) or a digitizing port.

It is not merely an 8 or 16K ROM address window.

6951. Adaptec ACB5500

You are assuming everyone used a drive for the same thing. I'd often take
my 1050 to a friend's house and need to change the ID setting (to copy
legal stuff, of course). Plus, without that switch, the 64 owner had 2
choices: Open the case & void the warranty, or (the dreaded method):

1. Turn on the 2nd drive.
2. Turn on the 64.
3. Place a disk with the dev8 to dev9 setting program in the drive.
4. Load & run the program.
5. Turn on the 1st drive.

>(And is counting in binary ALL that difficult?)

Nope.

I think it's an okay game on it's own, worth a few bucks. More
arcadish, not much strategy. Filling your energy stores while
skimming the sun is pretty neat (especially if you wait too long).

I bought a boxed Star Raiders cart last month to finally get a
manual... More to this game than I thought. Shows the equations
used to determine your ranking. (did you know blowing up a starbase
is USEFUL sometimes?)

How come SR has never been duplicated on other platforms? Has
anyone tried?

6963. Mouse Handlers...

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-03 06:28:40 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199412030628.AA107536111@relay2.geis.com>
Source record: 96742

There was a bit of talking about writing a mouse handler. As an essentially lazy programmer, I generally let other do the dirty work for me. For CardStax, I used Simon Trew's Multi-Mouse handler, which has versions for mouse, joystick and touch-tablet. It can be produced for different memory locations, the shape can be dynamically redefined... in short, it's a full featured handler.

Dave

6964. Drive Config & MIO II

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-03 07:09:36 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199412030708.AA184558539@relay2.geis.com>
Source record: 96743

The MIO II will apparently work with 512 byte sector drives. However, in the first revision it will only let you access 256 bytes per sector. A later revision will permit you to access the other 256 bytes. I believe Mike intends to have the physical drive appear as two logical drives, each half the size.

Drive config blocks. As per Analog #76:

NAME OFFSET USAGE VALUES
==== ====== ===== ======
DRVTRC $00 # of tracks $28 (40 track)
DRVSTP $01 step rate $0000
DRVSEC $03 # sectors/track $12 (18 sectors)
$1A (26 sectors - Enhanced Density)
DRVSID $04 # of sides $00 single sided
$01 Double sided
DRVDEN $05 density $00 single-density
$04 double-density
DRVBYT $06 # bytes/sector $0080 128 byte sector
$0100 256 byte sector
DRVSEL $08 drive select $01 drive 1 select
DRVSER $09 serial rate $41
DRVMSC $0A misc $0000

Compute of October 1985 also wrote about the Drive Control Block in Bill Wilkinson's "Insight: Atari" column. The standard was created by Percom. The DRVSEL, DRVSER and DRVMSC values shouldn't be changed UNLESS you're sure of the specific drive's foibles, as those vary depending on the drive. The DRVSER value given is for an XF551 on a PAL system.

: >in any Atari except early 400/800s, you need to add this extra
: >circuitry.

: Anyone know what exactly this extra circuitry is? Is the 6502C
: pin-compatible with the 6502?

Should be pin compatible...
The difference between the 6502 and 65C02 is in the chip manufacture.
The C in the number means the chip is CMOS as opposed to the NMOS
original. these two manufacturing techniques result in different
logic levels and need diffent interfacing.
the other difference As I understand it is that because of the advanced
Manufacturing techniques of CMOS the chips could actually be run at up
to 3 Mhz...

(This is only as I understand it, and I have looked in a few reference
books, and tinkered in various forms of electronics...)

CUL8R!

Multitasking can get pretty intense.

It isn't really that smart to set up a system were tasks are taking up 50/50 CPU time. The reason being that the odds are that one program isn't really doing much more than waiting for an input. So some form of intelligent monitor has to be written to figure out what a task is asking for and to give out its share of CPU time. And to assign PRIORITIES to each task. I believe even OS/9 goes this far into intelligent task management. With a slow processor, weeding out the 'waiting' programs and assigning them a low priority is crutial in maximizing throughput. I don't think Tom Hunt's MTOS went that far.

It's quite easy to have dozens of tasks running and not have a drain on the CPU as long as the tasks are mainly waiting for some form of interaction. The benefit of having all of these code blocks in memory, is that if they can COMMUNICATE between processes, then you can save memory. You eliminate redundant code that way. I believe the term for some of this is REENTRANCY. It can get pretty complex, but although you might think that all this is a huge resouce drain, like I said, it can in fact reduce code size and can be a very efficient way to operate, if it is all working together integrated.

Jeff M Lodoen (jlodoen@shell.portal.com) wrote:

: How come SR has never been duplicated on other platforms? Has
: anyone tried?

Maybe that would be too far for Atari's legal department to stand.

I have just got Wing Commander for the Amiga. After all the raving I thought it would be the best thing in the world, in other words, an updated Star Raiders, well, it is and it isn't. To make all us Atari 8-bitters feel better, it does NOT deliver the kind of simulation aspects that you get with SR. Although it does provide all SORTS of new perspectives, side view, even 3rd person views (which are kind of cheating) it doesn't have a truly interactive galactic map. It doesn't have a true sector scan (no gyroscope) and it doesn't have hyperwarp per se (only autopilot to 'cut to the chase' as it were). It doesn't have actual X/Y and distance meters for objects/orientation either although it DOES offer a ROLL feature which is nice.

What it does have are Capital ships, and it does scaling and rotation on some nice multicolored bitmaps for a total effect which is probably the best thing this side of X-wing. It also has a very cleverly written RPG aspect to it. In other words, instead of just being you vs. the Zylons for no apparent reason, it explains each mission in a narrative context, and you get to do different things like escort ships, and take on cruisers, etc... Also, the whole concept of having a wingman to help out and control via radio commands is neat.

Even on my A1200 with an 030/50, the animation is not as smooth as the starfield and sprites of Star Raiders. It's doing a HELL of a lot more work, but still, that's the end result.

The enemy AI is very good on WC, but in Star Raiders, their behavior is definitely faster paced and they are also pesky with their sandwich trap! SR enemies are harder to predict, let's just say that, and that is a good thing. Enemy prediction in WC is an important aspect of the game, and repayability is certainly going to suffer as a whole since WC has NO difficulty settings and only a single thread of missions to follow (unless you get the Secret Missions disk, I know of no WC mission editor ala Xwing). In other words, if you play WC enough, you will learn the right way to get past a mission and every time you play it, it will be like deja vu. Obviously when you are new to the game this won't seem bad, but after a while this will become tedious. This is never the case with Star Raiders where enemy placement is always random.

So even though I love Wing Commander for what it is, it is no replacement for the 3d simulation aspects of Star Raiders.

I don't think the sim aspects of SR will be outdone until someone comes out with a Babylon 5 Starfury simulator.

NOW----------

DID WING COMMANDER RIP OFF STAR RAIDERS??????

A question for the ages, yes?

Well, I'd say it did in some blatant areas.

The tagetting radar is mostly a ripoff.

Also, it uses a fixed starfield with things going by that look more like tiny asteroids than stars. This is like in Star Raiders where there are pepetual asteroids (although sometimes in small densities).

It avoids lasers and goes for a photon torpedoish weapon on both ends, just like SR although missiles are also in the game.

Energy repleneshes (I think) over time. You never really have to refuel. If you go back to the base the mission ends. Shields are like Trek in that they lose power and then recharge. However, you can get damaged weapons. Don't know about damaged engines. Similar to SR where one photon tube will be inoperable.

I'd say they copied some of SR, but I can tell they put a lot of work into the game regardless so I won't label it as a RIPOFF. They could have easily copied more aspects from SR and they did not.

One of the things I like doin in Star Raiders is just fooling around in space and with the Sector Scan and watching the game progress. It's a sim damnit and there are no strings on this puppet! With Wing Commander, if you decide to fly off course it is pretty pointless as you don't (as far a I can tell) ever run out of fuel. I haven't gone to the extremes with his. The map will reflect your change in course but I THINK eventually it bumps you back in a loop. It's not a galactic map pe se, we are talking sublight distances so it is a wholly different feel from the multilightyear scope of the Star Raiders environment.

6968. Re: Keyboards

Cross-posted to: comp.sys.atari.8bit,umich.archives

Speaking of Mods, I've come across a great one of AC/DC Thunderstruck.

I bet it would sound great on the 8-bit as long as it will fit. How big can it process MODs again?

This one is like 174K or something.

It even has some voice samples.

It's distorted guitar, scratchy singer, and percussion. I think 4-bit digital sound can handle that. Any distortion added by the 4-bitness would just add to the slop.

I mean, the sample MOD that came with the mod player I fooled with a bit with the 8-bit was a piano piece. Classical is NOT the best thing to play with 4-bit! Sounded like an AM radio going through a distortion pedal.

Ya gotta pick the right music that doesn't showcase the limitations..

6970. PPP PRODUCTS TO THE U.S.

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-03 11:11:08 UTC
From: dx107@cleveland.Freenet.Edu
Message-ID: <199412031111.GAA01556@kanga.INS.CWRU.Edu>
Source record: 96749

INTERNATIONAL DISTRIBUTION OF POWER PER POST (GERMANY) PRODUCTS

We are pleased to announce that DGS are now able to sell ALL Power Per Post products outside of the UK.

The versions we will be supplying are the International versions, with full English instruction manuals, and full English prompts, etc. within the software itself.

The current range of products available in the International PPP range are shown below, along with their prices in US$ and (UK pounds):

QUICK Programming language with support disk 1: $37 (18.50)

Screen Aided Management (S.A.M) package with Budget (spreadsheet) and Utils extensions disk: $44 (22)

S.A.M Designer - high-res graphics package for use with the above product: $14 (6.95)

Quick Ed character editor (doesn't need QUICK to run): $10 (4.95)

PPP Games pack (includes: Rubber Ball, Minesweeper, Glaggs It!, Bombi): $26 (12.95) ** SPECIAL OFFER PRICE **

QUICK Without the support disk: $28 (13.95)

QUICK support disk 1 separately: $10 (4.95)

Screen Aided Management: $28 (13.95)

S.A.M. Budget separately: $14 (6.95)

S.A.M. Util Extensions disk separately: $8 (3.95)

PPP Games separately: $10 (4.95) EACH

I'm sure you've all seen info on most of this stuff floating around on the net, so you should already know all there is to know about this stuff. If not, send some e-mail and I will mail back an info file I have put together on this lot.

All prices include delivery within the UK, but EXCLUDE international delivery,

which is 10% on top of your total order value (minimum $5 (2.50 pounds)).

Payments can be accepted either in CASH in US$, or by IMO in UK pounds.

All products are in stock, and ready for shipping.

6971. MASSIVE AUCTION V -- update #6 (includes Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-03 12:20:33 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3bpnqh$mve@usenet.INS.CWRU.Edu>
Source record: 96750

UPDATE #6:

MASSIVE AUCTION V -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI 8-bit computers COLECOVISION COLECO ADAM
COLECO 2600 ADAPTER COMMODORE 64 INTELLIVISION INTELLIVOICE
ODYSSEY2 PONG (2 types) SEGA MASTER SYSTEM TOMY TUTOR
TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

This is a rather large file (31,831 bytes, 1080 lines), so if you don't like large files, and/or auctions, PLEASE stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update after I'm sure the new one is accessible. I will also e-mail the list to all bidders, and anyone who requests to be placed on the auction e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON TUESDAY, DECEMBER 6TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX ITEMS!)

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #8)

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER, DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH.

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

ATARI 2600:

IF YOU HAVE A QUESTION AS TO THE TYPE OF LABEL, PLEASE FEEL FREE TO ASK.

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

AIR-SEA BATTLE (Atari)
ASTEROIDS (Atari)
ASTROBLAST (M Network)
BERZERK (Atari)
COMBAT (Atari)
E.T. THE EXTRA-TERRESTRIAL (Atari)
MISSILE COMMAND (Atari)
NIGHT DRIVER (Atari)
REALSPORTS: BASEBALL (Atari)
VANGUARD (Atari)

THESE ARE COMPLETE 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX AND POWER SUPPLY.

BID #1) $35.00 MacGregory
BID #2) MINIMUM OPENING BID OF $35.00
BID #3) MINIMUM OPENING BID OF $35.00

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

SEARS TELE-GAMES (ATARI 2600 COMPATIBLE SYSTEM) WITH BOX, MANUAL, ONE (1) ATARI JOYSTICK, ONE SET OF TWO PADDLE CONTROLLERS, AND NINE (9) SEARS TELE-GAMES CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

BASEBALL (Tele-Games)
BASKETBALL (Tele-Games)
BOWLING (Tele-Games)
BREAKAWAY IV (Tele-Games)
FOOTBALL (Tele-Games)
GOLF (Tele-Games)
PONG SPORTS (Tele-Games)
TANK-PLUS (Tele-Games)
TARGET FUN (Tele-Games)

THIS IS A COMPLETE 2600 SYSTEM, EXCEPT FOR RF SWITCHBOX AND POWER SUPPLY.

THE BOX AND MANUAL AREN'T IN GOOD SHAPE, BUT BOTH ARE INTACT.

MINIMUM OPENING BID OF $60.00

*****

LOT #5

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND TWO (2) GAMES [NO BOXES OR MANUALS FOR GAMES]:

DEFENDER
POLE POSITION

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THE POWER SUPPLY WORKS, BUT AFTER TESTING IT I DISCOVERED THAT THERE ARE EXPOSED WIRES AT ONE POINT ON THE CORD. I WOULD SUGGEST NOT USING IT, AND I ONLY SUPPLY IT SO THAT YOU KNOW WHAT ONE LOOKS LIKE, AND CAN READ THE SPECIFICATIONS FROM THE POWER SUPPLY ITSELF.

MINIMUM OPENING BID OF $32.00

*****

LOT #6

ATARI 5200 (4-PORT), ORIGINAL POWER SUPPLY, ONE ATARI CONTROLLER, AND TWO (2) GAMES [NO BOXES OR MANUALS FOR GAMES]:

POLE POSITION
SUPER BREAKOUT

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

MINIMUM OPENING BID OF $35.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 400 COMPUTER WITH ORIGINAL ATARI POWER SUPPLY, ONE ATARI JOYSTICK, ATARI 410 PROGRAM RECORDER, AND DELUXE INVADERS (Roklan) CARTRIDGE.

THIS IS A COMPLETE ATARI 400 COMPUTER SYSTEM, EXCEPT FOR RF SWITCHBOX.

MINIMUM OPENING BID OF $32.00

*****

LOT #8

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER WITH POWER SUPPLY, ATARI 810 DISK DRIVE WITH POWER SUPPLY, MOLEX CONNECTOR CABLE, RCA CABLE, ONE ATARI JOYSTICK, AND PAC-MAN CARTRIDGE.

I DON'T HAVE A DISK TO CHECK THE DRIVE, BUT THE POWER LIGHT COMES ON AND IT MAKES A SOUND LIKE IT IS TRYING TO READ A DISK.

THIS IS A COMPLETE ATARI 130XE COMPUTER SYSTEM, EXCEPT FOR RF SWITCHBOX.

MINIMUM OPENING BID OF $125.00

Uncle Fester (thester@nyx10.cs.du.edu) wrote:

: I don't think Atari ever actually managed to beat
: Commodore (Tramiel, remember?) when it came to reducing
: the retail price. Owning their own chip factory helped
: Commodore more than anything. That, and downright shoddy
: production standards. Commodore's disk drives failed at
: such a high rate, it was almost a 50/50 proposition for
: some time whether the drive a consumer purchased didn't
: have some sort of failure. Just how many revisions in
: that thing were there? 5? 10? More?

Even though I am a Commodore fan and C=128 active user, I must concur to some degree with your statement about shoddy production. However, I think that silly _design_ fumbles were as much to blame for high failure rates as build standards, if not MORE guilty. Take the early 1541 disk drives, for example. They were very large, heavy and ugly. They had internal power supplies that overheated very easily and locked up the drive, and subsequently brought the whole system to a grinding halt. (And of course, the stock serial bus was so damned slow...) This was good for the aftermarket industry, who came out with quite a variety of alternative drive devices. Anyway, Commodore finally wisened up and designed the 1541-II, which had an EXTERNAL power supply (biggest improvement), DIP switches for easy device renumbering, and an attractive slimline case. I have two of these on my #1 system - they are the most reliable 5.25" drive a CBM user could ever have.

There was also the 1571 disk drive, a.k.a. "Aircraft Carrier" for its long, wiide appearance. It initially came out with some quirky ROM chips, and the resulting problems might well have turned off a lot of people... But a careful redesign (and a clever aftermarket industry) came up with newer chips, and a better reputation was achieved. I have two of these on my #2 system.

: Atari built hardware that was rugged to almost military
: standards. Commodore built hardware that (for quite some
: time) barely managed to rise above the quality given to
: toys. To paraphrase "Field of Dreams":

: "Build it cheap, and they will buy."

: Compare the construction of the 400/800 computers (and the
: TI-99 for that matter) with the construction of the first
: Commodore VIC-20's and 64's and you will understand what I
: mean.

Hmmm, I wonder. Remember that Commodore had already established a reputation with their PET and SuperPET computers. These things were built like bloody tanks! Lots of metal, high weight, high volume, large footprint... And THEN came the shoddy VIC-20.

: As far as which machine is the "truly superior" one is a matter
: of taste. Much like the question of which is better, Sega Genesis
: or Super Nintendo? It all evens out when the technology of one
: machine is compared over the other by things like the abilities
: of a given programmer. Frogger for the Atari computers was never
: equalled on another machine of its class. Why? The programmer.
: Archon on the 64 was superior to the Atari. Why? Again, the
: programmer.

I agree wholeheartedly. It's not always just the hardware you have - it's _how you use_ what you have... In fact, this philosophy could apply to many other things in life!

: I own both Sega Genesis AND SNES. That way, I can
: purchase the superior version of a game that is written for both
: platforms.

I too have a SNES, but I don't have the income to support both that and a Genesis. Nor can I afford anything more than my two C=128's. (In addition, the time I would require to assemble and _learn_ a completely different computer system such as Atari would be prohibitive.)

: In 1979, the Atari computers were the winners, hands down.
: By the time Commodore came along with the 64 a few years later,
: Atari had only itself (and Warner) to blame for it's market loss.
: After all, the two machines were almost identical. What else
: but poor marketing can explain the demise of the "Real McCoy"?

I believe your statement that in 1979, Atari was head and shoulders above the competition. But I really wonder about the market since then. Are there specific spots around the world where Atari caught on more than elsewhere? I can't remember any of my friends or neighbors in New Brunswick (Canadian Maritimes) that owned Ataris. I can't remember any used ads for Ataris in Calgary! The only 8-bits I find are VIC-20's, C=64/128's, Apple II family, and an occasional Texas Istruments 99/4A.

: And that's my view. So what if I rambled?

If there's any place for rambling, it's the Internet! :-/ Thanks for sharing some microcomputer history.

: expansion options.

A real bootable DOS, huh? I always thought that _not having to boot up DOS
or BASIC_ was a plus for Commies. And this effectively made the C=64
virus-proof!! <smirk> And I suspect that many Commodore power users
have utility cartridges or ROM-based DOS wedges to replace what
admittedly was a silly directory lister. Yes, LOAD"$",8 was and still is
really stupid.

Better expansion options? I'm willing to have you list them to me in a
comparison chart. (I don't doubt you, I'm just curious.)

: I vote for MULE. Played it first on a friend's 64, then on my 8bit Atari.
: Loved it.

I have never owned an Atari, and rarely used one, so I can't make
comparative statements. However, I CAN just list some of my favorite C=64
games of all time.

Action: ALCON (Taito)
Defender (AtariSoft?)
Force 7 (DataSoft)
Gauntlet II (Mindscape)
Gyruss (Parker Bros.). Brilliant!
H.E.R.O. (Activision)
Lode Runner (Broderbund)
Raid on Bungeling Bay (Broderbund)
Robotron (AtariSoft?). Two-joystick mode!
Satan's Hollow (???)
Spelunker (Broderbund)
Spy Hunter (Sega). Two-joystick mode!
Star Control (Accolade)
Wings of Fury (Broderbund)

Arcade: Arkanoid II (Taito). Great mouse mode!
David's Midnight Magic (Broderbund)
Drelbs (Synapse)
Montezuma's Revenge (Parker Bros.)
Mr. Do! (DataSoft)
Night Mission Pinball (subLOGIC)
Pogo Joe (???)
Racing Destruction Set (Electronic Arts)
Super Off-Road Racing (Virgin Games?)

Sports: Epyx series - Summer Games I/II, Winter Games, World Games,
The Games, Summer/Winter Edition
Hat Trick (Capcom)
PitStop II (Epyx)
World Class Leader Board (Access)

Simulation: Chuck Yeager's Advanced Flight Trainer (Electronic Arts)
Elite (Firebird)
F-14 Tomcat (Activision)
Grand Prix Circuit (Accolade)
Stealth Mission (subLOGIC)
Steel Thunder (Accolade)

Strategy: Monopoly (Leisure Genius)
Overlord (Virgin Games)
Zenji (Activision)
Black Gold (Rainbow Arts)
Blockout (California Dreams)

And there are probably a few others that I would like to have mentioned, but can't remember or I haven't even tested them yet. And don't tell me that such-and-such a title didn't exist for C=64, because I've got originals of most of these sitting right in front of me.

Hello,

I've got a big box of parts that used to be an Atari 400, plus some cartriges, the tape recorder that went with the system, and a couple of the manuals that came with it. I'm moving soon, and unless I can find the box a good home, it's going into the dumpster. So if it's something you can use, please make me an offer. I'll give it away if that's the best offer I get.

NOTE: Everything is disassembled and in a jumble, so this is NOT a working Atari 400. Also, I think a couple of parts may be missing, so this is probably only good for someone who wants spare parts.

I'd prefer to find someone in San Diego, so that you can come pick it up. I don't have a car so shipping is a pain. But I *might* be willing to mail the pile of stuff to you if you pay the shipping.

Thanks,

Scott

>RAM under the cart. Is that how you get 32k? By using both ROM from
>$8000-$BFFF and RAM from $8000-$BFFF?

It just means that it needs at least 32K to run. That's why it doesn't run on an unupgraded 400 or 800(I don't even think on the upgraded ones, actually. I have a 48K Atari 400 that my dad got for the family when I was 2 years old. And the 32K cartridges don't seem to work on it...BTW: I have several other Ataris right now...4 or 5 130XEs, one of which I'm using right now).

BTW: Does anyone own/has anyone used a mulitplexer from CSS? I'd like to know how well it works, and if is really worth buying, since my dad is planning to try and get some for the Atari XE Group here in Ottawa.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

When I bought my Indus GT drive, it came with a version of DOS XL (I forget the version) and it had a little program that would turn on the high speed of the Indus drive. (GTSYNC ON was the command, I believe.) In the manual, however, there was a little blurb of a new program that would turn the high Indus speed on while loading DOS itself, as it was slower to load DOS from a high-speed disk, and the GTSYNC utility had to be loaded after DOS.
But my DOS XL master disk didn't contain this new utility, despite the fact that the manual talked about it. Does anyone have this program? Is DOS XL supported anymore?

>

Sir: Either you have never seen a PDP-11 or you've never seen a
TI-9900. I have programmed both of these platforms, and they're
NOTHING like each other. They're both 16-bit register-oriented[1]
machines. There the similarity ends. Like the PDP-11 has a stack.
The 9900 didn't. Subroutines used a register (traditionally R11) to
store return addresses.

[1] Yes, I know that the 9900 implemented the "register" file in main
memory using the WP register. This made that processer really well
suited to multi-tasking because you could swap out all of the
registers in one swell foop.

I believe Dterm had a pong game built into it so you could have
a game going on while downloading in the background. IMO: The problem
really isn't the processor or banked memory or anything else as
mundane as these problems. For instance, try declaring a byte array
in 'C that's greater then 64k on an 80x8x & see what happens.
I have Desq View & Windows on my clone, for the life of me I can't
see why anybody would need multitasking. The *ONLY* solid reason I've
ever heard was by Bill Wilkinson. He said he open windows (X) with
[compiler, WP], & continue editing code while a version was compiling.
When the compile was completed he'd just open another window to run
the code, if it crashed he just closed the window & edited his source
code rather then having to do a complete reboot. The only other applications
that even seem mildly interesting are a few bbs's that run several programs
at once for multi lined operation. Every time someone mentions multitasking
I used to challenge them to give me a reason why they need it. I've never
gotten a satisfactory answer from anyone except Bill.

Multitasking is useful if you have the CPU power to support it.

An 040 machine that can't multitask is a waste of available throughput.

Machines of that power are more powerful than older mainframes. They have more than enough power to support multiuser environments, which are by very nature multitasking.

Downloads are defininitely a dead time for the non multitasking machine. The #1 multitasking I do on my Amiga 1200 is during downloads. For instance, viewing pictures as each file completes itself from the batch download. Or uncompressing downloads as they come in file by file. This is a real time-saver as by the time the download is over I will have either saved off and/or installed or deleted the stuff I don't like. No time has been wasted waiting for the DL to finish.

Another one is printing. Printing to inkjets can be slow depending on how you do it. This can tie up the machine if it won't multitask. Some word processors spawn a process to handle the print in the background I believe.

Another is with graphics rendering. This can take a very long time.

Essentially, any task that goes on without user input, is worthy of running in the background.

Another is, let's say, having a FAX sentry look over one serial port, and having a multiserial board for a multiline BBS, and STILL be able to use the machine for your own personal applications.

With the Atari 8-bit, it lacks the throughput to do some of these tasks at all, let alone have enough cycles left to support other tasks so the point may be moot.

The best way to simulate some of this stuff on the Atari8 is to have a Multiplexer so you have multiple machines. It's just that during a download it may very well lock out the directory and/or drive it is writing to thus limiting your ability to process downloads as it is occuring.

However, it is ideal for things like BBSs.

Other big carts were stuff like LodeRunner where all the levels normally on disk were on cart, and Flight Simulator II which had all the scnery files on cart.

Ace of Aces used to require disk access to change perspective on its views. This created annoying lag (not unlike the CD lag in 3dO crash and burn by the way ;)) but with the cart, this was ROM resident which makes the game more playable!

The lowering prices of memory at this point facilitated this.

In fact I'd wager that MOST XEGS games were 64-128K using various schemes. I believe Crossbow and Crimebusters are big carts too.

The same trend was happening in the 2600 and 7800 arenas. However, in the case of the 2600 we are talking about 4K bank increments I believe as opposed to 16K on the 8-bit.

I have played with the MultiMouse handler. The problem I found with it, is that you couldn't move the pointer when the fire button was pushed down. Therefore things like drag operations where you hold the button down, drag, then release, were impossible.

I also found it nearly impossible to get the pointer to show up well on a Gr.0 screen no matter how much I played with color registers and priorities. It's some kind of limitation of the chipset as far as PMG interaction with Gr.0. I couldn't get a DARK PMG on a bright Gr.0 display. Dark invariably came out meaning transparency.

Okay, Mr. Technical, Moisture & High Voltage don't mix. Many computer
power supplies generate voltages much higher than line voltage, and the
presence of moisture could cause arcing, or lead to corrosion.

With digital logic, as long as the resistence of the fluid isn't low
enough to change the "state" of the inputs, it will probably work. However,
the circuit will draw more power as the fluid basically makes a lower
resistence from 5v to ground. Analog circuitry would not fare as well
as the conductivity of the fluid would throw tolerances out of whack.

The ST uses a lousy PLCC socket made by ITT/Canon that had a bad habit
of losing its grip on the IC. Atari's solution was to put a clip over
the chip to hold it in, but still many STs failed later in life due to
these sockets.

6995. Okimate 10

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-03 21:42:36 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <RG-3+8E.ransom22@delphi.com>
Source record: 96670

I recently cut a deal to get an Okimate 10 color printer for a good
price. Should be here in a week or so.

I originally had one of these back when they were newer-than-
new, and used it with my 1200XL. I was never impressed with it, as
it did a pretty poor job of printing text, and I was not interested in
color graphics printing (it was a present, so I didn't have a choice).
Anyway, my question is: what is this printer good for these
days? I'm buying it partially for sentimental reasons, and partially
for its color graphics capability. I recall it will work with
the KoalaPad's files. Does it work with te files created by ATari's
Touch Tablet software? How about the light pen software files?
Any other programs out there that work with it?
By-the-by, another point in its favor these days is that
Okidata actually still makes the "consumables" for it, including
print heads and film/ink cartridges. :)

Thanks,

Joe

[water vs electronics discussion]

I have often used soap & water to clean electronic and telephone
equipment. One problem is that some components and some types of circut
boards will absorb the water and expand or otherwide deform. This
deformation usually is not reversible when the equipment is dried.

I regularly clean keyboards by dissasembling, setting the PC board(s)
aside and scrubbing the rest. A compressed air gun is also a good
cleaning tool.

Yeah. How come the digital timer in my coffeemaker died when I spilled
water in it filling up the reservoir? And the car don't start when the
distributor's wet? And lightning kills swimmers?

The programming language QUICK is capable of producing programs that
are running - interrupt driven - in parallel (up to 4). To do this
you can write normal programs using a special library on any ATARI with
a ramdisk.

Unfortunately the docs for that library are only available in german
right now, while QUICK itself is available in english.

: In fact I'd wager that MOST XEGS games were 64-128K using various
: schemes. I believe Crossbow and Crimebusters are big carts too.

Well ... I don't know about Crossbow. However, Ace Of Aces, Dark
Chambers and Into The Eagles Nest were big memory games.

: The same trend was happening in the 2600 and 7800 arenas. However, in
: the case of the 2600 we are talking about 4K bank increments I believe as
: opposed to 16K on the 8-bit.

Yep ... the first 2600 games were only 4K. Later, Atari managed
to squeeze as much as 64K into the cartridge. Games like Solaris and
Secret Quest showed off this memory.

7800 games were often 128K (1 megabit) or greater ... especially
the later titles. On that platform, Scrapyard Dog, Commando, Midnight
Mutants, Alien Brigade, Basketbrawl, Mean 18 Golf, and Tower Toppler were
a few of the larger games.

YES!!!!! You keep heat from dissipating away from the power
supply, so it burns out much faster.

What a big nonsens! Every segment on the 8088 is as large as the whole 6502
memory, 64KBytes. And the segmented model of the 8088, as bad it is for
applications and data larger than 64K, it's fine for apps smaller than 64K,
and it makes multi tasking (with some basic kind of memory protection)
much easier.

: 800XLs (only one which works right now). The older one has a much more
: robust keyboard, that feels ALMOST as good as my 800. The more recent one
: has a poor keyboard, but it's still light years ahead of the XE keyboards.
: Is there any easy way to hook a 1200xl keyboard onto a 130xe or even an
: 800xl? I've got a spare 1200xl keyboard, and would like to put it to use.

Speaking of keyboards... and the 130XE (the Atari 8-bit I use most of the time - I guess I have just developed my own special techno-emotional attachment to it).

I used to really dislike my old 130XE keyboard... This was the keyboard made by Sugiyama and had the double layer mylar and was the one where you could replace the internal silicone contacts with the XE Touch upgrade contacts from Best Electronics.

After performing the upgrade with the XE Touch contacts, I was definitely less than satisfied, because even though the keys were no longer as mushy the tactile feedback and the "throw" was just too hard, at least for me.

So.. I ordered the Mitsumi keyboard with the single layer mylar from Best Electronics and was pleasantly surprised. This keyboard has the springs underneath the keycaps and I have come to actually enjoy this keyboard!

It is still not the same as the 1200XL keyboard but for the 130XE it is definitely better in my opinion than the Sugiyama keyboard with the XE Touch upgrade.

From at least my experience with the 130XE, and I have had several :) (still have the ORIGINAL 800!) most of its keyboards are of the "mushier" Sugiyama variety.

Matthew R. Singer LM Technology
yea, my old atari 400 was a wonderful machine, wonderful display list
interupts, IOCB's, memory maps of peeks and pokes, ectera. Everything
worked great. When I bought an ST, It would crash after being
on a little while. It must have shorted when it got warm. (oil drop?)

Gosh, I enjoyed programing the 400 in assembly, writting little
games as good as anything commercially available for the atary 2600.
It was a wonderful way to learn about computers. You really got
a sence of what the 6502 was doing when you had to count cycles to
see how many times you could change the registers of the player/
missile graphics sprites during each raster scan.
I never really got into the ST like i did the 400,
It just was not as nice of a machine. Well, I've got a
486 now, and I have no clue of what the various components
are doing, i think its kind of a shame.

Anybody out there ever read De Re Atari? There is a nice
chapter in there about programming philosophy.
Mark Lindeman.

>Certainly he had a good enough grasp of the CPU as you do to have
>considered what you are speaking of.

Multitasking probably isn't practical on the Atari8, which is why no one has done it. But that has little to do with generic multitasking on the 6502, which was what I was originally responding to. Multitasking is difficult to add into an already existing system that was designed with only single tasking in mind.

Now that I think about it a bit more, the biggest problem with multitasking on the 6502 is going to be memory management. Especially zero-page. There's no way you would want the overhead of swapping out ZP when task switching, so programs would need to have dynamic allocation of only a portion of ZP. If a program needed more ZP than what was available, it would fail to run. Main memory has to be allocated in the same fashion, and so both ZP and main memory addresses have to be in a relocatable file format.

Multitasking on the 65816 chip gets lots easier, because you can move ZP around, and actually give separate ZP's to each application. Plus the 24 bit address bus gives you plenty of ram for multiple applications. This would almost be workable for Atari8 applications, except for hardware registers and OS ZP usage, that has to go to its specific place.

Here's where the pre-existing design comes into play. Given the above 65816 model, it would be trivial to write a new application that forced hardware and OS ZP into their respective locations. Add a fully relocatable file format, that relocates everything else, and you'd have it. But that doesn't help run yesterday's applications.

: with Nintendo. Had some great graphics power, but a pitiful RIOT chip
: for sound (same chip from the 2600).

From what I gather, the 7800's first release was barely a month
and was yanked when Jack took over. The sound sucked, but at least a few
games get around this limitation, thanks to in-cartridge sound chips. The
graphics and animation capabilities were greater than the NES, though.

: Anyway, I hear they stuffed 'em in the warehouse for tax reasons?
: Why, exactly?

I've heard that Jack wanted to focus all of Atari's limited
resources on the ST. When the NES took off, he dusted off the 7800 and
through it onto the market. Considering how little was spent promoting
it, the 7800 was quite a success.

I'd have to say that back in 1983 when I spent my $1000 for a
C64 and a 1541 I picked it over the Atari's since the only C64 had
gotten into the schools (up in Ontari before those stupid Unisys-Useless
Unix WannaBees came into the picture). Plus back then the Commodore's
were Everywhere in Ontario I guess since Commodore started in Toronto..

Sadly I could never really program for the machine since when I
finally got a C compiler for the thing it NEVER linked... but now for the
Amiga I do have one that works.... :) I guess it's time to do some damage..

Well as they say the rest was history.... :)

Well, I believe that it does come down to 16K banks. The 8088 may
automate this to some extent. It is a very confusing kind of memory
addressing. You've got 3 levels of segmenting. 16, 64, and 640K in your
usual DOS/Windows box. What you can't see and what appears not to exist
or is automated is still taxing the machine with overhead cycles and of
course for difficulty in programming which is why so few programmers
relish Intel assembly chores.

I would argue that for certain tasks on a Low Budget the XL/XE is ideal.
Until last summer I had a bog standard 800XL with 1050. I maily used it
for word processing, and used the excellent PD program TextPRO and for
better output Daisy Dot. To be honest I have yet to come across such a
good PD wordprocessor. Thats taking into account the Amiga I had until May
and my present machine a Falcon.

IF you want to do word processing and require 'power without price'
an 8-bit will do nicely.

>really stupid.

Okay, look at it this way. In 1979 (Maybe 1980) Atari came out with
DOS 1. Had this been a built-in system, the Atari never would have had
the far better disk formats that followed with real subdirectories,
time/date stamping, etc... The Atari was designed to load add-ons to
its OS and do it automatically. This also meant that the novice user
could put a game in the drive and just turn on the computer. On the
Commodore, you didn't get anywhere until you typed LOAD"GAME",8,1. It
just shows that Commodore didn't expect anyone to want to change the
way the 64 worked. Also, having a real, bootable DOS meant you had a
complete set of disk utilities. Atari DOS could copy files with
wildcards, duplicate entire disks, rename, make boot disks, format,
etc... Only a few of these options were available to the 1541 owner (at
least not without additional purchases).

>Better expansion options? I'm willing to have you list them to me in a
>comparison chart. (I don't doubt you, I'm just curious.)

Atari used a 13 pin serial connection for its peripheral expansion called
the SIO Bus. One device chained after the other like 1541's do, however,
all these devices (and more) were available from Atari:

410 cassette
810 disk drive
850 RS232-Parallel interface
835 direct connect modem
820 40 col printer
822 Thermal 40 col printer
825 80 col printer
1010 cassette (replaces 410)

1050 disk drive (rep. 810)
1030 modem (rep. 835)
1020 4 color plotter
1025 80 col printer (rep. 825)
1027 LQ printer
This list cover most of the peripherals up until the XE line changed them all again. The thing is, rather than put a bunch of special connectors on the 8-bit, Atari put one "intelligent" chain to make expansion easy. These devices could even be "hot-swapped" without any problems. If you needed better throughput, there is the Parallel Bus which allows high-performance devices (such as hard drives) to communicate directly with the CPU/RAM. I believe the 64 also has a CPU direct bus.

It wasn't originally available, thgough. And it came out in disk,
first, so they could get useres to de ug it and then pay for it a second
time on ROM.

I believe those 32768 words were 16 bit words. To be byte-addressable
requires 16 bits to address 2^15th locations of two bytes each.

7030. Windows, disks, MULE PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-05 00:19:07 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199412050018.AA167826732@relay2.geis.com>
Source record: 96606

Over the past few days, a number of my posts via UTexas never made it to the group. I've brought them together here into one post. If you're not interested in Windows for the 8-bit, MIO II and 512 byte/sector drives, drive control blocks from SIO floppies, or the game MULE on the IBM PC, skip this message.

Sub: Eight Bit Windows
Sent on 11/30/1994 at 1:02a

I've been looking at Diamond GOS for a while now; it's quite interesting. It includes memory management routines. The intent was to make RAM banking transparent to the programmer - it maps any expanded memory into a pseudo 32 bit address space by using RAM expansion handlers.

I think any "windows" for the 8-bit has to support both text and graphics modes. You just can't get adequate speed when every image being manipulated is bit graphics. For a paint program, DTP, or WP preview graphics 8 is fine. But for a desktop or word processor you've GOT to have a text mode to get good speed. Analog once published a routine for windows in graphics 0; I had it running in graphics 8 as well, since both are 40 bytes wide. My version used a single calling address, and checked the number of arguments to know whether to open or close.

I'd be glad to help out with an 8-bit Windows project; I write with Mac65 (disk version), under Sparta 3.2gx.

Sub: Drive Config & MIO II
Sent on 12/02/1994 at 1:36a

The MIO II will apparently work with 512 byte sector drives. However, in the first revision it will only let you access 256 bytes per sector. A later revision will permit you to access the other 256 bytes. I believe Mike intends to have the physical drive appear as two logical drives, each half the size.

Drive config blocks. As per Analog #76:

NAME OFFSET USAGE VALUES
==== ====== ===== ======
DRVTRC $00 # of tracks $28 (40 track)
DRVSTP $01 step rate $0000
DRVSEC $03 # sectors/track $12 (18 sectors)
$1A (26 sectors - Enhanced Density)
DRVSID $04 # of sides $00 single sided
$01 Double sided
DRVDEN $05 density $00 single-density

$04 double-density
DRVBYT $06 # bytes/sector $0080 128 byte sector
$0100 256 byte sector
DRVSEL $08 drive select $01 drive 1 select
DRVSER $09 serial rate $41
DRVMSC $0A misc $0000

Compute of October 1985 also wrote about the Drive Control Block in Bill Wilkinson's "Insight: Atari" column. The standard was created by Percom. The DRVSEL, DRVSER and DRVMSC values shouldn't be changed UNLESS you're sure of the specific drive's foibles, as those vary depending on the drive. The DRVSER value given is for an XF551 on a PAL system.

Sub: MULE on the PC
Sent on 12/02/1994 at 1:37a

I recently found a program called MULE386 on one of the Umich mirrors. It's a version of MULE for the PC. Has anyone managed to get it to run? I get a Runtime Error #1.4711. A decent version of MULE for the PCwould be great!

One other question: does anyone have english docs for the program? It's from Germany, hence the docs are in German. Ich non bin ein berliner.

- All this from Dave.

7034. Help: Trying to Fix Atari 800 machine

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-05 05:13:12 UTC
From: Adam Skwersky <askwersk@mit.edu>
Message-ID: <3bu7h8$7bg@senator-bedfellow.MIT.EDU>
Source record: 96612

Hi!

I have an Atari 800. It worked great for a long time, but now the video/audio is becoming really bad. Under all that fuzz and static I can still see that the machine is basically working, but the display and sound is fuzzled!

I tried replacing the audio/video/cable but that did notsolve the problem. I tried soldering the audio/video directly to the motherboard, but that didnt work (hope I didnt fry anything). I'm starting to believe there may be something wrong with the audio/video chips. Has anyone else had this problem? What did you do to solve it? Is anyone selling their Atari 800 or similar system?

Please email directly to:
askwersk@mit.edu

Thanks,

Adam Skwersky

7035. Emulating an Atari 8-bit on a Mac?

Not yet.....

>I understand it can emulate an Epson LQ-510.

I don't know about the 200e specifically, but the 4000 (which is
compatible with the 200e) can do both Epson LQ and IBM ProPrinter
emulation.
I have had success with a (PC) graphics program that wanted to print
to an Epson MX-series, and with text programs that do all the
different type sizes.

>If so, does that give it compatibility with the old 9-pin Epsons??

Looks like it to me, although it's more likely to be compatible with
the 24-pins Epsons. (Wasn't the LQ-series 24-pin?) Maybe soon I'll
try Print Shop on the Atari with the Canon.

7040. Re: multitasking - 6502?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-05 06:21:54 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <128905@cup.portal.com>
Source record: 96618

Well, there we go with about 5 or 6 examples of what you can do
with multitasking that I never use. I use the break I get during
downloading to go grab a sandwitch or maybe another cup of coffee.
I can't think of the last time I D/L'd a picture & the concept
of decompressing it & viewing it while I'm still online is a little
unusual to me. I'll ACK you are probably in the majority on the
picture thing though. alt.sex.erotica.bin or whatever is the number
one group on the net with something like 250,000 people/week loging
in. I have both a real fax machine & a 14k fax modem, but nobody faxes
me so why should I care if I can get a fax in the background? Ditto for
printing stuff or generating fractals. I have a multi user family
environment, but they each want their own keyboards/boxes. I almost
bought a printer buffer since I'm not real hot on running spoolers int
the background, but I resisted the temptation. I have maybe a total of
maybe 10 megs of stuff I've DL'd over the last ten years out of the
80 or so megs of stuff I keep on my hard drives. 1 meg a year just doesn't
require that much time online that I need my computer to multitask.
I think J. King just said it's been his experience that everyone just
replies on line rather then transfer responses they've composed while
downloading in a multitasking system. I sort'a give a lot of weight
to his emperical data over what you should be able to do with a
multitasking system. I have to say while it's theoretically possible
to do that kind of stuff, in reality no one does.

This is exciting. I was thinking about this about a year and a half
ago. Jim King said he and his friends were working on a banked ram
handler like that.

I'd like to know more about how this works.

You could START by taking STXformer 2.5. The source was released to the
PD. Since it is C this might be portable.

It's not necessary, in fact, you'll gain speed and efficiency if you leave that out or at least make it selectable. AmigaOS don't use it, Novell Server os don't use it.

Remember, a buggy program isn't less buggy because of some mp, the only thing mp does it too prevent it from hurting the rest of the system. But, OS/2 crashed quite often, it uses mp. :-)

That's right. the manual for the multi-tasking library is in german only,
because one part of that package is an assembler program, written for
the BIBO assembler that is also just availabe in german.

>I don't know if its a true multi-tasking software product or just

Ahem, you are spekaing of multitasking in a multiprocessor environment. Multitasking can be done using one cpu. In one CPU-system some form of priority and/or time-sharing is involved too, or maybe cooperative mt is used(Windows).

Task-switching is a somewhat homemade term.

DL using a modem takes some time, a 200kb pictures takes a minute or two,
during that time I have viewed it and perhaps deleted it.

Think of what happens if you select 15 files to download and the
terminalprogram tells you that your hd can't take all these files, then you
can, during the dl, move some files to another partition. Very handy.

Another thing is that things like module-players can be tasks and not stupid
hardwarehacks that wedges the IRQ's.

That's where Gunther fails and many other BBS programmers, they use BASIC
to compile, perhaps bcoz they want the program to be easy to modify. But
as we all know, there aren't many talents on machine language in the
states, I don't know why, but the Euro scene is way ahead there, and more
strange is why NOONE from Europe have done a BBS program for the 64 - ever!

Well, since it's 8 bit, it would reduce to about 90K or SO
with the 4 bit Parrot method that we use. Contact Bill Kendrick for
a modified version of his Tbasic XL player I wrote that uses XE memory
for something like up to 120K playing capability. I did this
months ago.. so I'm fuzzy on the details.

I've been booting up disks with the timing hole covered with my Percom for 12 years now. (It was the only drive I had for 8 years.) The timing hole is used on a Percom when you format the disk (not read it). The formatting routine is built into the drive directly as a part of the ROM in the drive. No DOS can get around the Percom drive ROM. To format the back side of a disk on a Percom, you either must format it on another drive or punch another set of timing holes in the jacket. Booting off the back side of disk doesn't require the extra timing hole. (Unless there is some ancient version of the Percom ROM, I'm not familiar with.)

I have mule386 working on my PC. There is a text file - I can't remember whether it is a .ini or a .cfg, but this needs to be set up to the spec of your PC (sound card, speed etc)

The only problem I have with the game is that every time a scrolling message goes across the bottom of the screen the display goes funny. This is a big disadvantage as there is always scrolling on the status screen at the start of each round - Consequently I can't tell when I am winning :-(

They have also remodelled (for the worst in my opinion) the stores.

They game wouldn't be too bad if the above problem was fixed.

Boulderdash works fine for me on PC Xformer.

What kind of drive did you have? If it was a 1050, I think there are programs that will read the disks on a pc drive. If it was an 810 you are out of luck. Perhaps you can find a used one cheap.

7062. Re: Re 6502s

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-05 20:09:56 UTC
From: brain@msen.com
Message-ID: <7JpukmoZjuYI072yn@msen.com>
Source record: 96654
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,alt.folklore.computers

To recap this discussion:

The original 6502 was manuafctured by MOS Technologies (NOT MOSTEK), and was designed by some of sma people that worked on the 6800 CPU from Motorola (Chuck Peddle, Bill Mensch, etc.). That is why the instruction sets are so similar. The first part was actually a 6501, which was pin-compatible with the 6800, but Motorola slapped a suit on that, and the part was dropped. The 6502 had differing pin out, but only needed one clock input. Now, through cross-licensing agreements made to appease each of the companies and foster sharing of ideas, the 6502 was manufactured by Synertek and Rockwell, as well as by MOS. Now, NOS was acquired by Commodore in the '80s, and the name was changed to Commodore Semiconductor Group.

In eariler posts, we have seen that the 6502C was a Atari-specific ship that incorporated extra circuitry on-board. The CPU is NOT pin-compatible.

The 65C02 (Note the difference in placing of the 'C') has a history as well. Bill Mensch wanted to design a CMOS version of the '02, but CSG was not interested, so Bill started his own company, Western Design Center. He completely redid the chip in CMOS, and added some new opcodes along the way. CSG then slapped a suit on him, but a cross-licensing agreement was reached, so the part went into production. Originally, the part could only run up to 4Mhz, but 1994 parts can go up to 10MHz. At about the same time, Bill started work on a 16 bit version, the 65C816. Oh, the 65C02 and 6502NMOS are pin compatible. The 65C816 is not, though. Now, Rockwell had cross-licensed the C02, but wanted a few extra instructions, which I don't know the particulars of. Anyway, since '816 dev was ongoing at the time, the extra opcodes were added, but the Rockwell part used opcodes that were not upward compatible with the 65816. THe stock 816 merely used previously unused opcodes in the 'C02 opcode space, but it used them all. (I think the part is number 65802 by WDC, but not sure)

Now, the 816, which is completely backward compatible with the stock C02, can run at up to 10MHz now, and WDC has versions up to 16MHz in engineering sample stages, slated for next year prod.

I have the complete NMOS6502 opcodes, the complete 65C02 opcodes, and the complete 65C816 opcodes.

For clarity, the old 6502 line:

6502 apple, atari, cbm
6503 thru 8502 cbm

is denoted N6502 (N for NMOS in front of number).

I have used both, but never had a reason to program either. I simply assumed
that TI's claim that the chip ran a subset of the LSI-11 instruction set
was correct.

>
>You haven't been looking in the right places, then. I got the latest
>issue a month ago. Subscriptions are nice ;)

Hmm...maybe the subscription got cancelled after we lost our mailbox for a short while('our' as in the Atari XE Group). We used to get it all the time and now we never get it at all. Or maybe our old librarian has the subscription and not us...and he's living in Richmond, Virginia.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

I can name one: Panama, and maybe other parts of Latin America. About a year ago they still had new boxed 130 XE's for sale. Atari seemed to do exceedingly well over there, all the way from the 2600 to the ST range, although now Nintendo have all but taken over.
The XE line did well in Poland too (after Tramiel took over him being Polish and all). Does anyone know if he pushed the Commodore in Poland?
Of course with the recent changes changes in Eastern Europe selling western computers over there now is much easier than it was when Tramiel was at Commodore.

Firstly yes Page 6 NEW ATARI USER is still in existance only now it is
just called NEW ATARI USER, it is published by Page 6!

Its British and it needs your support. They take credit card orders
so non-UK residents can easily subscribe.
the current price is stlg15 for six issues (a years worth) but thats the
UK price, to the USA it will be more to cover the postage.
Write to: PAGE 6, PO BOX 54, STAFFORD, ST16 1DR, ENGLAND
for more info.

ACE OF ACES, a good game but as far as I remember it doesn't need to
access the disk for every view change. The cartridge version is very
expensive, but in the UK we could get the tape version for stlg3. The
interesting thing is that it can detect a 128k machine and load all
the code instead of accessing the disk or tape for each type of
mission. But don't forget to use the START key on the final pink
screen or it won't rerun!!

Not quite the original Apple machine -- this was for the ill-fated
Apple III. Seems the automated assembly line that was used to
manufacture them had some problems getting the chips fully in
the sockets.

: Task-switching is a somewhat homemade term.

In task-switching, as I define it, while you are running a given task, the other task is permanently frozen. Even if you remain in that task for an hour, the other task will not do a thing. Even in windows, it goes a little beyond this. The other task has to request cycles and the task you are in has to yield cycles. It is a manual give and take within the programs as opposed to a 3rd party (the task manager) doling out cycles based on configurable priorities, etc...

: BTW: Does anyone own/has anyone used a mulitplexer from CSS? I'd like to
: know how well it works, and if is really worth buying, since my dad is
: planning to try and get some for the Atari XE Group here in Ottawa.

There are only 2 problems with the multiplexer.

First, it locks drives/directories a lot. This is to protect the FMS from corruption. I don't have specific examples of when this happens, but with 16 megabyte partitions, if you expect to be reading and writing to the same partition from 2 different machines, you might get locked out WAY too much. I think the locks happen mostly on writes as opposed to reads, where the sector count would be altered. I do know that Sparta is more annoying than MYDOS in this respect, because you get an error AND both drives will POP back to the main directory ala a CWD > command. This is the update mode lock 'feature'.

2nd is that although I and others have pestered Bob a lot for it, there is still no way to use partition swapping software with the MUX. Therefore you are limited to 8 or 9 times 16 megs per partition maximum simultaneous storage. If you, like me, have PBI floppies, you will have to often go into the BB menu (essentially temporarily killing the MUX) to swap in those drives. If I had a board up with a large file area, I would be fighting for drive ID space between the board and my personal partitions. The MUX system is only v1.00, and I am generally disappointed that Bob didn't take the initiative to fix this in he las _4 years_ because it limits its effectiveness on its biggest application (BBS and personal slave usage).

The data rates only get, at best, a 10% hit compared to a direct PBI connection. It is hardly noticeable.

It used to be on GEnie. But that won't help you. I used to have a
personal copy and I uploaded it onto an ST board which went down last
year.

Maybe it's in the ST archives via ftp.

I'll take a look at it. I've been toying with the idea of writing a windows
version of mule - but don't have the time yet. An X11R5 unix version for
network games would be really cool! This too is on the back burner.

Not the original Apple or Apple II, but the Apple III. A machine
that should have had a fan but didn't, and had an amazingly high
defect rate. Almost all were upgraded to an Apple III+, but few
were sold (relatively).

```
UPDATE #8 -- next to last update:
---------------------------------
MASSIVE AUCTION V -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!
-------------------------------------------------------------------------
Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI 8-bit computers COLECOVISION COLECO ADAM
COLECO 2600 ADAPTER COMMODORE 64 INTELLIVISION INTELLIVOICE
ODYSSEY2 PONG (2 types) SEGA MASTER SYSTEM TOMY TUTOR
TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****************

This is a rather large file (31,772 bytes, 1077 lines), so if you don't like
large files, and/or auctions, PLEASE stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is accessible. I will also e-mail the list to all
bidders, and anyone who requests to be placed on the auction e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

************************************

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

************************************

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON TUESDAY, DECEMBER 6TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN
PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX ITEMS!)

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.
```

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #8)

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER, DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH.

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

ATARI 2600:

IF YOU HAVE A QUESTION AS TO THE TYPE OF LABEL, PLEASE FEEL FREE TO ASK.

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, AND TEN (10) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

In a previous article, krishna@max.tiac.net (Glenn M. Saunders) says:

>where the sector count would be altered. I do know that Sparta is more
>annoying than MYDOS in this respect, because you get an error AND both
>drives will POP back to the main directory ala a CWD > command. This is
>the update mode lock 'feature'.

Have you used SpartaDOS 3.2g or 3.2h(whatever version we're up to now, I'm
not sure)? It's mostly MS-DOS compatable in the way that it uses most of
the same commands(ie. cd to change directories, del to delete a file,
etc.). FTE seems to have really improved SpartaDOS since they took over.
But I have heard that there's still a few bugs to work out of these new
versions.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

7079. MIO and RS232 Flow Control

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-06 02:56:54 UTC
From: tdrake1@umbc.edu
Message-ID: <3c0jtm$qif@news.umbc.edu>
Source record: 96558

For all of you MIO users out there...

I have heard that hardware flow control is now available for the original
MIO at the RS232 port. Is this true? And if so, how is it done??

I know that the stock MIO did not have hardware flow control.

Exactly.
I got a 1040ST thru mail order. When I opened it up and used it, I found that
it couldn't boot the GEM. I could only use disks that had "autoruns".
Called customer support and he told me to pick it up and drop it a few
times...didn't work. Sent it back and got another one that worked fine.

Via a disk handler that will take over from the ROM handler. It was
written by a PRO! sysop. If you call a PRO! board and ask for it you can
probably track it down.

Does anybody have some active PRO! board numbers I can try calling so I
can ask about getting the disk flow control handler for the MIO's RS232
port? The ones I have must be old.

Thanks!

>sit in a warehouse for 18 months, and re-released it in 1986 to compete
>with Nintendo. Had some great graphics power, but a pitiful RIOT chip
>for sound (same chip from the 2600).

The RIOT chip in the 2600 had nothing to do with sound. It was (as the name suggests to those who have been staring at too many acronyms) simply some RAM (128 bytes), 16 I/O lines, and a timer. The other chips in the system were the processor (6507), and the 'do-everything' graphics and sound chip. (The ROM was plugged in, and address decoding was done by magic. There is a reason for the 7404 in some cartridges).

The sound was pitiful, and they may have used the same specs for the 7800, but they certainly wouldn't have used the same chip. And it definitely wasn't the RIOT.

Source record: 96569

Some months ago I posted to the AtariNews that I'm working on a asynchronus clock switcher. Today it is done and it works good.

Now I've an XE with an extra (seperated) bus on wich the 65C816 runs with 5MHz (at the Moment I've only 5MHz versions, but there are still 10 or 14 MHz versions wich can be implemented simply).

If the CPU is accessing to bank 0 ($000000-$00FFFF) it will run with 1.79MHz. On the rest of the banks there's no speed limitation.

If the CPU is operating in the higher banks the screen refreshing done by ANTIC has no affect to the CPU (CPU won't be stopped) because the ANTIC works on the normal ATARI bus and the CPU has its own bus and so is there no conflict.

Mario

R. GORE (CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK) wrote:
: ACE OF ACES, a good game but as far as I remember it doesn't need to
: access the disk for every view change. The cartridge version is very
: expensive, but in the UK we could get the tape version for stlg3. The
: interesting thing is that it can detect a 128k machine and load all
: the code instead of accessing the disk or tape for each type of
: mission. But don't forget to use the START key on the final pink
: screen or it won't rerun!!

I don't know about the cart or the disk, but the tape version of this game really did my head in. I had a shot of it from someone, and after taking half an hour (almost) to load it in, I lasted 30 seconds, got killed, and if I remember got an end game screen which I couldn't leave- so I had to load it again for another game. NO WAY!
Anyway, I got my own copy when I bought my second hand 130XE, but it's more hassle than it's worth. I don't think it can be Transdisked either. Looks like a good game, but the loading time *totally* ruins it and makes it unplayable. So the cart's got to be a good idea.

Anyway, can anyone tell me if it's really neccessary to reload the game each time?

: computes and runs BASIC, the 1050 lights up and shunts the heads about
: 1/4" towards the centre when you switch it on. I hard-wired the peripheral
: sockets on the 2 boxes together, and now switching on the computer produces
: a beep and "BOOT ERROR" message which takes longer if you shut the drive door.

Yes, mine does that too.

: Am I right in thinking that it needs a DOS disc to boot from? Where can I
: find something that'll do the job?

You can boot from any correctly formatted disk which contains the correct files
so any DOS 2.0/2.5 (the standard DOS) disk which boots will probably contain
enough of DOS 2.5 to get you going. I've had my machine for 8 years, and
I've never had the full DOS 2.5- never needed it!
If you come across DOS 3, don't use it, it's not standard, and you'll
regret it later. It's incompatable with DOS2.0/2.5.

Also, the cartridge slot: I read an ancient
: book that said it was compatible with "all Atari software". Does this mean
: fun things like VCS cartridges?

No, I'm afraid it doesn't- the 2600 is a different machine. Even the carts
are a different size, so it's pretty obvious when you try and plug 'em
in. Sorry!

: Thanks for any help. I'd love to get the machine doing something useful,
: even if it's just Pac-man....

There's a version of PacMan available...

Whenever I get instructions like these, I always translate them to
sanity, viz. "Open up the case and reseat all the chips that are in
sockets."

Much more reliable than throwing your computer around the room.

To run Atari on the Mac, you could first find an old Mac Charlie IBM emulator for the Mac (with the slide-on extra keys for the keyboard). Then run the Atari emulator for the IBM under Mac Charlie.

It would never bomb and run really fast.

Source record: 96580

I find it restricting these days to use a system that doesnt multitask to some extent. It came in real handy a few years back to be able to play Civilization and download and upload files at the same time. Its very nice to be able to unzip mail packets as they arrive (and not have to wait for them all to arrive).

I suppose its just the way you like to do things. Reminds me of my father who usually proclaims "A car is a car." Some people dont like to do things the same way as others.

At any rate, multitasking is very useful and anyone who cant find a use for it is certainly in the minority.

See ya, Joe

> bjcorr
>

When I picked up an extra cpu I also got a ton of software included.
Included was Last Starfighter and Star Raiders II. They are both pretty
much alike except for the "perimeter" alarms, shield controls, and
scrolling over the planets. Thus, you are correct, one is a rework over
the other. It's possible that Atari realized there was a potential of
original Star Raiders players readily purchasing a game called SR II.

When it was released it had excellent features. Heck, compare it to the
Star Wars game - no comparison, SR II leaves it at the starting blocks.

>Ahem, you are spekaing of multitasking in a multiprocessor environment.

OK, let me clarify:
In multitasking, multiple programs *seem* to be running at the same
time. That is, while you are using one program (in the "foreground")
the other programs continue to do their work in the "background".
With a single processor, the processor's time must be divided between
programs, but the switching is fast enough that as far as the user can
tell all the programs are running simultaneously.

From: rfunk@magnus.acs.ohio-state.edu
Message-ID: <3c28c7$789@charm.magnus.acs.ohio-state.edu>
Source record: 96582

Two examples of how multitasking has been useful for me recently:

1 - A few weeks ago I wrote an 8-page paper, and printed it out on my
old 9-pin printer. It took a total of about half an hour to print,
but during that time I was able to go on and do other work, such as
making a cover page and references page.
That was, however, when I finally decided to get a new printer the
following weekend.

2 - When I am online reading news or whatever, I can have my mail
program running in the background, checking for new mail every 5
minutes, without me noticing anything until it does find new mail. If
an article I read mentions a file I can download, I start up my ftp
program and let it download in the background while I continue to read
news.

I have been hearing people talking about a game called M.U.L.E. and how good this game is. What is this game and how does one play it?

Also: what is the difference between the atari 400, 600, 800, etc?
I picked up an atari 600 at a thrift shop really cheap, because I wanted to play some of the cart games that a friend of mine used to own when we were kids.

Also, this past weekend I saw an atari 800 computer (the older model with the 2 cartridge slots, [i think it's the older model]) at a garage sale with about 10 cartridge games for $50.00. Was this worth it? I didn't think so at the time, but I really wanted the games. It was a rather nice classic collection. There was no tape drive, disk drive, or anything with it (except a power supply DID come with it)

I also saw an 800 at a thrift store (also the older kind w/2 cart slots) for $9.99. Would that be better than my 600? Thanks for humoring a newbie:)

Some people on comp.sys.apple2 say they replaced the 6502 with a 65C816
without problems. The pinout differences don't seem to matter in an
Apple //e.

My Apple uses a 65802, which is basically a 65816 with only 16 address
lines, totally pin-compatible with the 65[C]02.

Wow, sounds great! Could you improve the decision making circuitry in
charge of slowing things down... maybe so that only the hardware
and cart areas slow the processor down? Or.... can we get standard software
to run in bank 01XXXX? Nahhh. they's choke when writing to hardware and
OS...

This is terrific progress toward improving any software currently
written for the Atari.... With things the way you currently have
them running, only new software would run faster, but those new programs
would run way faster with a 8mHz or 10mHz 65816 in there.

You really oughta send some mail to
ftooned@delphi.com about this... and see if they could incorporate
such changes into a Rev 2. Mars-8 board.

Problems with 6502 multitasking: there is no way to protect the operating system from a malicious or buggy program. Even if you did your context switching in an NMI (such as the vertical blank), and used some bank-selection scheme to provide each process with a separate address space, any process which is buggy or malicious could easily take over the system. A truly secure multitasking system must feature a processor with different priveledge levels, otherwise all multitasking must be"cooperative" to some extent. Pre-emptive multitasking is possible, but only if the programs are well-written, and don't do something which crashes the system or disables the context switching.

You are right, the "Stella" (2600 code-name) manual floating on the net
says, well:

"The TIA is a custom IC designed to create the TV picture
and sound from the instructions sent to it by the
microprocessor."

Another file with general 26/7800 specs says:

"The sound is exactly the same as it still uses the Stella chip
(except Ballblazer which has its own sound chip in the cartridge)."

Was "Stella" just the TIA, or the 2600 in total?

>kids.

The Atai 400 is a 16K computer with a membrane keyboard. NOT
recommended.
The Atari 800 is what you saw at the thrift shop and flea
market. Full-stroke keyboard, expandable to 48K of RAM (easily, that
is...can be expanded to much more, but just try to find the necessary
equipment! [Grin]).
The 600XL and 800XL have, respectively, 16K and 64K built-in.
The 600XL can be upgraded to 64K with a plug-in module (the 1064 it is
called) which may still be available from B&C Computervisions. Both
have built-in BASIC (buggy revision B) and full-stroke keyboards.
the XE line includes the XEGM (a detachable keyboard, 64K of
RAM, built-in BASIc and Missile Command), the 65XE (full-stroke
keyboard and 64K of RAM), and the 130XE (full-stroke keyboard and
128K of RAM).
All share the same line of peripherals, and almost all software
will run on any of these (within memory requirements, and the XL/XE
lines may require a Translator program to run some software.)
Oop. Forgot the 1200XL. 64K, the best keyboard of the line,
nearly unexpandable and arguably the worst video output.
Also, the 400 and 600XL do not have Monitor Output jacks, and
thus can only be hooked to a TV with a TV/Computer switch box. All
others can produce monitor output through a monitor jack with the
appropriate cable.
This isn't anything but the bare bones about them, but
you get the picture, I hope. :)

>Also, this past weekend I saw an atari 800 computer (the older model with
>the 2 cartridge slots, [i think it's the older model]) at a garage sale
>with about 10 cartridge games for $50.00. Was this worth it? I didn't think
>so at the time, but I really wanted the games. It was a rather nice classic
>collection. There was no tape drive, disk drive, or anything with it
>(except a power supply DID come with it)

For a garage sale, I'd say no, that wasn't a good deal. I'd
expect to pay $20 or so for that. However, on the open market and at
the few stores still selling Atari stuff, that would be a fair price
or a bargain, depending on whereyou are shopping.
This assumes the 800 had 48K of RAM. You can find this out

without turning the unit on by opening the cartridge door, then turning those little platic things near the rear of the cartridge area, then sliding the whole cart door and attached top case portion up and forward. Underneat there will be a 10K ROM cart (marked as such), and some other boards, marked with the amount of RAM in each. Usually you will see 3 16K RAM boards. Some older ones may have only one 16K RAM board. Really ancient ones may have only one 8K RAM board.

>I also saw an 800 at a thrift store (also the older kind w/2 cart slots)
>for $9.99. Would that be better than my 600? Thanks for humoring a newbie:)

It wouldn't be a bad buy, again, if it had 48K.

Anyone have anything to add?

-Joe

jharris@cup.portal.com said;

Multitasking probably isn't practical on the Atari8, which is why no one
has done it. But that has little to do with generic multitasking on the
6502, which was what I was originally responding to. Multitasking is
difficult to add into an already existing system that was designed with
only single tasking in mind.

Now that I think about it a bit more, the biggest problem with
multitasking on the 6502 is going to be memory management. Especially
zero-page. There's no way you would want the overhead of swapping out
ZP when task switching, so programs would need to have dynamic allocation
of only a portion of ZP. If a program needed more ZP than what was
available, it would fail to run. Main memory has to be allocatiihe
same fashion, and so both ZP and main memory addresses have to be in a
relocatable file format.

I agree completely..

The most complicated MMU built for a 6502 series CPU has to be the one on
the Commodore 128, a machine that does a tap dance with two separate CPUs
and 3 factory operating systems. I know it can make ZP do tricks, but you'd
have to ask on comp.sys.cbm or find a literary reference somewhere for
real info :).

Mike

7123. SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-07 03:02:04 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <128977@cup.portal.com>
Source record: 96598

Thanks for the lack of response for free SIO2PC boards. Just
before Xmas it was really going to be tight for me to spend
the money anyway & since nobody wanted one I won't have an
order made up.
Anyway I thought I might post the design since it is a done
deal. I still have some problems running it high speed with
SD 4.19, but it seems to work well at regular speed with
either SD or MyDOS in any density. BTW: I had the same
problem with the original SIO2PC so it may be the serial port
of my clone. All IBM pins refer to a 9 pin serial port.

```
ATARI 5------:-1 7 14-:--ATARI 10
:-2 4 13-:
IBM pin 2------3 l 12-:
ATARI 7------:-4 s 11 open
:-5 0 10-:--see below
IBM 9----------6 0 9-:
ATARI 6--------7 8--:<--ATARI 3
& IBM 5 1N914 diode
```

```
Pin 10---:-----/\/\/\/----IBM 3
_:_/ 1K
/ /\ 5.1V zener
:
GROUND
```

The colors I've found are
ATARI PIN
5 green
3 orange
7 violet =>cmd
6 black =>ground
10 blue =>5V

I've also tried it with a 4.7k pull-up resistor going from
ATARI pin 3 to the +5V supply (like Nick did) & it didn't
seem to change the results.^

: Well, I wouldn't go *THAT* far. The 2600's sound capabilities
: were quite impressive by 1977 standards. However, Atari should have
: improved the 7800's sound when it was released. The graphics were a
: tremendous improvement, but the sound was disapointing.

That's not necessarily true. The Astrocade had more memory (4K ram) and
a better sound chip (3 voices) circa 1977. This came at a price of
course. I believe the Astrocade uses the first of the popular Yamaha
type sound chips which the Vectrex and Atari ST use.

If not, it was quite similar.

The 2600 sound was OKAY in 1977 but was by no means IMPRESSIVE.

7125. Re: MIO and RS232 Flow Control

Hardware flow control in the form of a software handler? What kind of nonsense is that? Hardware flow control is only enable on modems, rs232 cables and interfaces that are CAPABLE of such throughput - usually via a UART.

No, it also used the 6502C at 1.79mhz rather than a 6507 at 1.33mhz.

The cart addressing I believe was a fairly healthy figure, compared to
the 2600's paltry 4K. It would have been really crippled had they not
made some improvements on memory addressing, which they did.

True, but I was quoting. If the cart says "Super Game" (and all of
those I have use red lettering on the end labels) it has a POKEY.
Hat Trick, Impossible Mission and others as well. AFAIK, of course.

Yes, it's possible. Some Cartridges (ACTION!, SDX, MAC/65, ...) copy
only one page or two pages of its RAM in the XL-memory. For instance, in
the SDX-EPROM are 64kB Software, but the cartridge use only about 8kB.

They wasted a shitload of money doing it that way. They could have packaged a POKEY inbetween cart with all new 7800s manufactured and offered a "sound upgrade" inbetween cart for the old c) 1984 machines.

Then they would have been able to take advantage of Pokey in ALL the Tramiel-era 7800 games.

Actually, the ATARI 8-BIT did have multi-tasking of sorts.... The ATARI LOGO cartridge had four of what were called "turtle program areas". All four turtles were supposed to run independently, but in reality Turtle #1 ran four times faster than all of the others. The turtles were described as running independently. Each turtle also had an interrupt for collision detection with the background. While there is no way of prioritizing the tasks, you might be able to make a visual task scheduler by creating a closed loop race-track for the turtles to run on and placing background lines for the turtles to cross at regular intervals. The turtle whose task you wanted to prioritize could have more lines drawn across its course to create a greater frequency of collisions so that its "on collision interrupt" routine would run more frequently. Well, it is a thought, anyway... I don't know if it would work or how many instructions you could run pre-emptively. It would probably be fairly crude as far as multi-tasking goes.

7137. [--- ITF/ZIP Interpreter ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-07 11:03:38 UTC
From: winston@merk.com
Message-ID: <D0FtE3.963@merk.com>
Source record: 96513

For those of you out there in net land, let me fill you in on where I stand on trying to transfer the ATARI 8-bit Zork database into the ITF Database interpreter. I had last figured out that one of my problems was that I couldn't work in double density or enhanced density. Using the CIO program from "Mapping the ATARI" and a program posted here, I used the CIO "POKE" codeblock and the "PLA, JSR DSKINV, RTS" loaded into page six to fetch a sector into page six which I then "PUT" bytewise out onto a datafile. This method thrashed the heck out of my disk drives, but I decided not to try anything fancy to begin with. (I probably should have used a 20K string as a buffer and then wrote the string out as a block). Using this method I created two datafiles of 368 sectors of 128 byte sector format. I passed the two disk data files to the ATARI 800 ITF/ZIP database converter and got the following output:

```
Version is 3
Game file has length 84876 checksum 41257
Cmn 496 vcb 15137 obj 688 glb 8817 last 82872
Trying to split at res+1...
oh well. got to search for it. this could take a while...
Trying 16000
Trying 17000
:
Trying 67000
Split point 68032
checksum 41257 gsum 41257
```

All thus seemed to go well. However, when I then attempted to run the ITF interpreter on the newly converted datafile I get a response of:

```
Internal Error #21
```

My questions to any and all who have used the ITF ATARI 800 database converter is:

-- Were the results from the ATARI 800 database converter correct?
-- Does the ATARI 800 database converter need to be fed 125 byte sectors with the sector links excluded or does it accept a disk image with sector links ? There is no documentation about sector links either in the source code or in the documentation. (I will take another look after sending this letter, just to be sure.) I would assume that since the hard sector links are not mentioned that they are therefore not a problem ?
-- Has anyone used the ITF/ZIP ATARI 800 database converter successfully?

Thanks.

The 600XL comes with only 16K of memory. That's enough for most game cartridges (except for the newer XE games), but you would need more memory to use a disk drive. Most 800's (the older model with two cart slots) had 48K. The 800XL (looks like your 600XL, only bigger) came with 64K memory, and some people upgraded them to 256K or more. All the XL and XE models except the 1200XL have Basic built in; you use a Basic cartridge on the 400, 800, and 1200XL.

Joe, it just ain't so. There was a poll taken of computer users just a few years back & the results went something like 80% of the people just used their computer for a single task i.e. word processing. Fewer then 25% of the people with computers use them for telecommunication so the claim by a couple of people that they use multitasking during downloading is by definition in the minority. The company I worked for, Alza Corp, is one of the top 50 companies in Silicon Valley. We recieved write ups in computer magazines for having one of the highest ratio's of computers to people & other then maybe the LAN server, not a single person uses multitasking in any form. I realize there is a built in bias, but trust me on this: Not everybody is on a bbs & everybody that logs in does not spend hours downloading files. Granted it may be the way you want to work, but for 90-99% of people it is tits on a bull.
Rick

Recently I have posted an article detailing special offers on some of
my software products, however somewhere along the line the text got
'corrupted'. Before most of the UK prices you will have seen the
letters stlg, don't ask me how they happened but on my screen they
were definitely pound signs!!!!
I thought they might have been replaced by the hash (#) sign but
obviously not. Anyway sorry for the bodge. In all future postings I
will use the hash symbol to represent UK pounds and the dollar sign
to represent US dollars - quite logical really.

If you have any queries or questions about any of the software please
feel free to e-mail me at chmrig@leeds.ac.uk

Please ignore the next bit, its just so I can see which keys produce
which signs!

pound sign stlg
hash sign #
dollar sign $

>Was "Stella" just the TIA, or the 2600 in total?

I have heard from an ex-Atari employee that Stella was just a codename for the TIA while it was being developed. The "Stella" name was never used much, except for in a "how to program 2600 video" document written way back when at Atari. This is the document that someone uploaded to the Internet, which explains the popular use of the Stella name.

Hello all!

I picked up an amazing machine yesterday, and I think this is the group
that can tell me about it. I never used an 800 much, but I had several
games for it. Having the 800 out as a game unit was kind of a pain. Well,
I came across an XE (it's gray, with pastel buttons, a removable keyboard
and a light gun, and an XE joystick, all working) with the flight
simulator and bug hunt carts. I was first of all amazed at the case (it
looked SWEET), and secondly I was amazed at all the ports this had!
I hooked up seperate audio and video to my TV, and WHAM! Beautiful
picture. Then, out of curiosity I plugged in some of my 800 carts, and
they all worked! I was beside myself! The thing loads missile command
when no carts or keyboard is attached, and loads basic when no carts in
and the keyboard attached. POking around, I also came across a self test
which seemed pretty thorough!

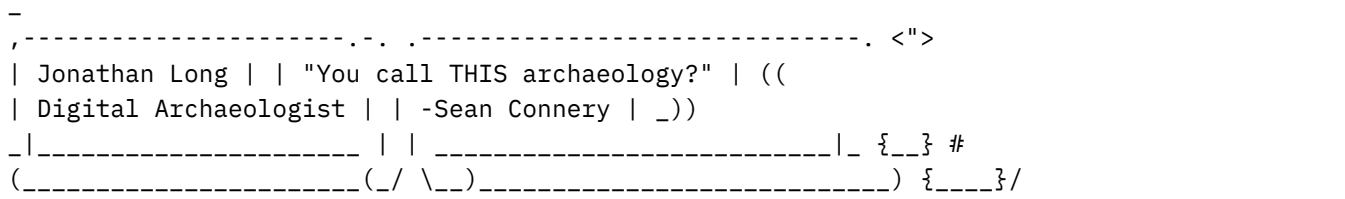
Now, for the question. What kind of XE is this? Here's the numbers off of it:
XE system SN: A1821147360, FCC ID: EBA72RXE. Do these tell you anything?

I don't see the FAQ posted, so can someone either send me that or tell me
what periphs I can use with this? (Like the 1050? DD i see talked about)

Again, I am amazed! This is the coolest machine I think I have ever come
across, and man-oh-man is Pitfall 2 a blast on this thing!

Oh.. Um I also have a GORF cart which I can't get to work on this
machine. Have there been problems with that cart, or is it maybe
defective? (I cleaned thoroughly with 94% Isoprop.)

Thanks for everything you can tell me. I am a convert!



Finding the keys to the future is in first studying the
locks of the past.

Sorry, but you're wrong. RIOT was indeed used to generate sound on
the 2600, using its timers. Note that POKEY sort of does the same
thing... it can be used for sound generation AND high-speed timing.

Message-ID: <9412071838.AA00636@dylan.newi.ac.uk>
Source record: 96527

Last week, I posted a message regarding a new Atari 8-bit software project provisionally titles ADOS (Atari Developer's Operating System). Discussions are currently underway to try and finalise the design of the software.

It is hoped that the ADOS project will lead to better use being made of the Atari 8-bit and allow programmers to get away from using the standard 64K memory. It is a general-purpose operating system primarily based around a windows environment. Since it is such a big project (probably the biggest Atari 8-bit project ever), we need to gather as much programming talent as possible.

So if you can program and have some useful ideas then contact me requesting to take part in the discussions.

: The 7800 definitely did use the same sound chip. The only major
: differences between the 26 and the 78 is that the 7800 has the MARIA
: graphics chip and more memmory.

Andrew, the Maria chip accounts for a NUMBER of differences:

- The 7800 has higher resolution and more graphics modes
- The 7800 has a larger pallette
- The 7800 has superior sprite handling capability
- The 7800 has superior scrolling abilitiy

In addition to that:

- The 7800 can have larger memory cartridges
- The 7800 has a two button joystick

The 7800 is a MUCH more powerful machine than the 2600.

>Ahem, both the Amiga and the Novell OS uses pre-emptive mt without mp.

Both the 680x0 family, and the 286 and above, are protected-mode processors.
I am not familiar with Amiga-DOS, are you saying that it does not use
protection? Does it run all of its processes in supervisor mode?

>remeber, a buggy program is still buggy, even if you have mp. Why use buggy
>programs?

Because most programs are buggy?
When a program crashes on a single-tasking system, only one program (and the
work being done inside it) is lost. When a program crashes on a multitasking
system which is poorly designed, it can take other programs with it. A
well-designed multitasking OS will protect processes from each other.

On the 6502, I know no way (in software) to prevent a program from executing an
instruction which can compromise a system's integrity, short of the processor
"emulating" itself--having a program which fetches each instruction, checking
to make sure it is legal, and then simulating it. (Clearly, this is not a
viable solution... :))

Things MIGHT be able to be done by adding extra hardware--it is simple to
guarantee each process its own address space with bank-selecting, process
pre-emption could be done with an NMI (making sure that no user program could
"turn off the timer"), and instruction priveledge can be accomplished by
making the hardware which does all of this able to disable itself in software,
but requiring an NMI (or a BRK instruction) to re-enable itself.

Recently I picked up an Atari 800XL. I figured to use all my old
Atari 800 games and disks with it. However, when I got the 800XL home I
noticed that it had a different power connecter from the 800. Of course,
the 800XL didn't have a power supply. I have tons of power supplies
lying around. If I knew the pinout of the Atari 800XL power connector
I am sure I could rig something up. Does anybody know the specs of
the 800XL power connecter?

>what periphs I can use with this? (Like the 1050? DD i see talked about)

(FAQ sent.) The XEGS you have is about equivalent to an 800XL or 65XE,
with 64K in there. You can use a 1050 and most other peripherals for the
8-bit Atari. A couple of things the XEGS lacks is the PBI/ECI port, and
the monitor port.

> XE system SN: A1821147360, FCC ID: EBA72RXE. Do these tell you anything?

Umm...well...the FCC ID number really has nothing to do with the Atari
model name. It's just an ID for the Federal Communications Commission in
case your computer starts activating nukes in some other country because
your computer is sending off such strong radio waves. The SN number...that
the Serial Number. If you take it off, you could be considered stealing.
The simplest way to find out what kind of XE you have is to look at the
two or three digits next to the letters 'XE' on the top of your console.
(ie. 65XE or 130XE).

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

AmigaDOS processes are run in user mode, but there are OS calls
(Supervisor() and SuperState(), I think), which allow any process to
run in supervisor mode.

Huh? I beg to differ. The manual that was with my Astrocade had C) 1977 plastered all over it. Even a couple 1976 copyrights.

5 years after 1977, the Astrocade was having its last stand. No, it was not sold in huge numbers, but it was indeed released in 1977 as far as I know. I used to have a stack of Arcadian newsletters going back to at least 1978.

The Astrocade was half designed as a computer, and I think it followed the lead of the TRS-80 by using the Z80 and having 4K RAM. However, it added better sound and graphics than the TRS-80 had.

One of the reasons it failed was probably because it must have sold for almost the same amount as a full computer back then.

Not only that, the GFX chip runs out of special high speed video RAM (7.xx mhz I believe) which is how it can move enough pixels to get performance up to Sega Genesis levels.

Aside from the TurboGraphics 16 maybe (which uses a 16-bit GFX chip but an 8-bit CPU--classify as you will), the 7800 was the most powerful 8-bit game console as far as graphics is concerned. Not much question about that.

: Bally released the Personal Arcade in 1977. It was re-released as the
: Astrocade (was it still Bally?) in 1982, maybe earlier. Same machine.

I think the rights changed hands once, maybe twice. The name changed several times, and the console went from black to white, to black, etc...

Some of them say Videocade, some say Personal Arcade, etc...

Just as Atari had "Power without the Price", Bally had "Fun & Brains".

They kinda barked up the wrong tree by offering educational style games which weren't that great, like Biorhythm.

The undersling keyboard never came out, even though both companies that owned the machine promised it. Atari wasn't the only company famous for vaporware.

The only thing the newer owners are responsible for is a newer Basic cart that saved to tape faster.

The guy who wrote the Basic cart was also responsible for writing Palo Alto Tiny Basic. He sounded like a real guru, and also wrote, I think, an extended Basic for use with a couple of the RAM upgrade boards that plugged into the back S-100 style expansion bus. Unfortunately the original Basic couldn't autorecognize expansion memory.

Overall, though, the 2600 beats the Astrocade simply because it has HARDWARE SPRITES. The Astrocade had to blit everything and so the 2600 can do smoother animation.

Another big reason, maybe THE reason the Astrocade failed is that it never got 3rd party cart support. It's catalog is way too small and most of the early stuff is as bad as the 1st 2600 carts, only higher resolution.

Another benefit of hardware sprites is being able to throw up more colors. If all you have is a 2 or 4 color playfield, your players are going to be the same color as a lot of the playfield. With hardware sprites, you can have them stand out by using unique colors.

: Sorry, but you're wrong. RIOT was indeed used to generate sound on
: the 2600, using its timers. Note that POKEY sort of does the same
: thing... it can be used for sound generation AND high-speed timing.

Right on. I tried to explain this in another newsgroup but got shot down because I couldn't actually state it in the most technical of terms. Harry Dodgson is the worst offender when it comes to fighting over semantics on how the 2600 and 7800 operate. I think he was the one that fought on me on that one. The reasoning I used to explain how the RIOT works on the sound is to compare its tempered tones to Pokey, and how these are not exactly diatonicaly pitch-perfect because of the nature of the timers subdividing themselves (ala De Re Atari). And how it probably also uses the same hardware timers to generate distortions.

He seemed to think that the RIOT chip was not used at all for sound generation. I'd find it hard to believe that sound on the 2600 is as CPU intensive as doing speaker pumping ala digitized sound. It has to trigger a RIOT frequency et. al. and the tone (I should hope) will continue until changed by the CPU like when you do a SOUND command in Basic and when you break it, it keeps on going. It doesn't require CONSTANT CPU byte stuffing to keep the sound rolling at a given frequency. He seemed to think it was more like an IBM speaker or something.

I mean, the 2600 has to already update the video constantly, it would NOT have enough cycles left to produce tones by pushing the speaker directly. It would come out as a series of stacatto pulses representing the space inbetween free cycles for the sound routine.

: Last week, I posted a message regarding a new Atari 8-bit software
: project provisionally titles ADOS (Atari Developer's Operating
: System). Discussions are currently underway to try and finalise the
: design of the software.

I may have missed the specifics of this.

Is this goig to be a DOS or an OS replacement?

If it is an OS replacement, it will be a plugin ROM, right?

You mean like doing Diamond again?

I don't think the Atari resolutions are suitable for a windowed
environment. There aren't enough colors, it would be slow, and crowded. It
is a waste of resources.

I think you could probably extend a command line system into something
more task oriented ala Unix...

Writing a software driven MMU to help make banked RAM easier to use for
mainline code would be very useful.

Compatibility with existing languages would be a problem, but you could
try to coordinate your efforts with FTE since they are working on
updating the languages (I think).

What you've acquired is the wonderful Atari XEGS (XE Game System). It
has two internal games, but no internal basic.

GORF will work, but I believe the cart has to be plugged in backwards...
or at least mine did (backwards meaning the label facing away from you).

Any information pertaining to the 800, 800xl or 130xe will remain
valid for the XEGS.

> >> Mark <<
I have often wondered WHY a second cartridge port? I love my 800 and am
loath to part with it, though the PBI of the XL series is tempting, and I
have often woudered if more could not be done with the second cart port.
Right now I use it for my R-Time8, does anyone know what carts were made for
the second port? I recall Monkey Wrench, a cart for use with Basic that
added some features, but that is all. It seems a neglected resource. Could
it be used for I/O like a MUX?

I would love to see an Atari 800XL emulated on my Mac. Although I know
of a PC emulator, there is none for the Macintosh. I would love to port one.
Does anyone have source code to an Atari emulator that could be tinkered with
to allow it to run in a Mac window?
(I tried running XTender inside SoftPC. SLOW.)

7171. Internet gateway as BBS cheat

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-08 06:28:18 UTC
From: krishna@max.tiac.net
Message-ID: <3c6922$m3v@sundog.tiac.net>
Source record: 96550

I once suggested this long ago, but tonight I started writing some BackTalk macros to do this. Looks like it would be fairly trivial to set up some macros for Unix shell users...

Right now my macros log into my account, upload a given file, enter IRC, enter a channel (#A8NET) and I also have a macro to download a file and logout.

I can't finish the macros because I need to test it with someone else.

Both have to get into IRC onto the same channel, and have a hardwired nickname for IRC.

The tricky part is getting Backtalk to keep on trying long enough to handle any sync problems.

One end would send first, the other would be set up to receive.

I realize that using Backtalk may seem like a waste of time since it is not an extension of the BBS. But if a given sysop has a MUX, it could be somewhat automated. By somewhat, I mean that Backtalk has a limitation of only being able to do Xmodem. That means both packets would have to be .ARCs.

If a given net package is usually send as several files, this would not work too well because you'd still have to manually arc and unarc.

I just want to demonstrate that even though Backtalk doesn't have VT100, it can easily navigate through the shell, sync up 2 DCC connections, and get out.

This MIGHT be a good solution even if it will require manual net updating by the sysops because you can assign a time overnight for the transfer to take place, and you don't have to both be doing it at the same time.

You can worry about updating the BBS on your own independent time.

Tom Hunt was working on a script terminal of some kind, but I learned a while ago not to wait for things to happen and to treat things as though what we have now is all we will ever have.

If any sysops would like to beta test this with me, let me know...

It seems like such a waste that sysops are paying long distance to network when they could use (if they have one) their cheap unmetered shell account to transfer packets. This is, of course, especially painful for the international network.

7173. XEGS, Gorf and CardStax

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-08 10:39:37 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199412081039.AA083653177@relay2.geis.com>
Source record: 96551

The XEGS (and indeed anything except a 400 or 800) will not run Gorf. There are a number of game carts that don't run on the newer machines; the list includes Demon Attack, Protector II, Attack at EP CYG 5 and Crossfire.

I had an XEGS for a while - it is a nice machine. To boot up Missile command without unplugging the keyboard, just hold down SELECT when you power up the machine.

CardStax 2.1 has been uploaded to Umich! (Finally got through at 3:30am). If you've got v2.0 from one of the pay services, the differences are minor, mostly cosmetic - you can really quit the programs now, without resorting to a RESET and POKE 580,1. There are 3 files - a brief text file, plus two sides of a SD disk. Docs are on side B, along with a second stack I put together for a user group disk newsletter.

That amazing ATARI a bloke was talking about, the one that loads Missile Command from memory is an ATARI XEGS (XE GAMES SYSTEM).

It was the last 8-bit computer Atari made and sold. Hey it was even sold here in the UK!

Its basically a 64K 130XE in a different box with a revised OS to account for Missile Command and a separate keyboard! I think the policy was to sell it as a games machine and then offer the keyboard as an upgrade. Yes you can use all the standard serial peripherals like a 1050, but since it doesn't have a PBI you can't use a black box or other PBI device.

I have seen them upgrade to 128k, with inbuilt printer interfaces and the ComputerHouse Controller card fitted!

>Loved it.
>

I did that in the reverse order, myself. Trivia question:

Who else noticed that MULE for the C64 used Atari's built-in
type font?

How do you play MULE with more than one player on a C64? (or for
that matter an Atari XL or XE?)

Has anyone ported MULE to the PC yet?

I'm gonna have to drag my Atari out of the closet. I haven't
played MULE or Alley Cat in ages...

Strange, but I remember opening up my 800 'bout 12 years ago or so. There
is this sizeable edge connector on the back of the motherboard (under
where the RAM cards sit) that was half hacked off to get it to fit in
the case. I have heard of two purposes for it. One was that it was
a test connector, the other is that it was a high spped disk i/o
port that Atari decided that noone needed or would use. Anyone
know anything?!

>(This, for example, is being sent at 2 AM on December 7th). Does anyone know
>of any other, better gateways for me to post via?

Excerpting from the FAQ:

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Source record: 96410

Hi,

I can certanly help you with some code, I have written years ago for my
800XL. It is a modification of the standard ATARI-OS. I have rewritten
parts of it and and included some new features. Tis modified OS is
still compatible to the original one.

The features are : build in DOS (single and double density)
build in DOS-shell
ramdisk driver for 256kB expansion memory
modified SIO-routines to support HAPPY's ULTRA-speed
superfast boot (1 bootsector with ULTRA-speed and
you are in the DOS-shell)
the cassett-driver has been removed (no C:)
all is contained in a 16kB EPROM

Since I no longer work on my good old 800XL, I can only help with the
printed source code or an EPROM containing the code.

Please contact me for further information,

Wulf Wulfhekel

Li Chen Wang - lived(s?) over on Tennyson. I have a pile of source code that has his name on the top for a 4K integer BASIC (for Z80 of course). A friend swears that he wrote the Level-I BASIC used by the original TRS-80. However, that basic had 4-byte floats. Does this jive with other memories?

Other features of Level-I basic: you had >TWO< string variables - A$ and B$, and you could assign to them and print them. That's it -- no string comparisons. And they were limited to 16 chars each.

Scott

They have to print sometime, and when they do, they don't want to sit
around waiting for the printer to finish before going back to
something useful. I bet most people don't even notice their Windows
printer spooler until they have to go without it.
The idea is to put the non-interactive jobs in the background so you
don't have to think about them -- then as far as the user is concerned
they're only doing a single task, while the computer may be doing 3
things at once.

Message-ID: <D0I9zL.HIo@world.std.com>
Source record: 96423
Cross-posted to: comp.sys.atari.8bit,ne.forsale,misc.forsale.computers.other

I have the following Atari 800XL stuff for sale or trade:

1 working 800XL
1 dead 800XL (sticky keyboard, bad motherboard. I had two dead that
became one working system.)
1 floppy drive
1 tape drive
1 printer
(all original Atari hardware. I can get more information if desired.
As far as I know, it all works-- the disk drive and tape drive do,
but I didn't have any paper for the printer...)
A stack of disks, tapes, and carts-- mostly games
A stack of magazines (Antic, Compute!, and others)
Other random bits of stuff-- TV adaptor, etc.

I will accept pretty much any offer for this stuff, since it's just taking
up space right now. I'd prefer not to ship it, but I can if you want, or
you can pick it up if you're local to Worcester, MA.

I will accept as trades Amiga (2000) stuff, old Mac stuff (I have a Plus),
1x8 SIMMs, DRAM chips (48 of them give me a 9-meg Amiga :), SCSI hard
drives of pretty much any size (even tiny!), or whatever. Ask!

Make me an offer! Anything, even ridiculously low!
Email me at mute@world.std.com!

Today I had my last final of the quarter, so maybe now I can finally
get a few things finished.

I should have a lot more of the reference card done by the end of the
month. Error codes are my first priority. BTW, Ivo van Poorten has
put what's done so far into hypertext format on his Atari 8-bit Web
Page (whose URL I don't remember), and it looks really good.

I managed to get a clean printout of an OLD (1984) article I found
about connecting Atari joysticks to PC game ports, and I scanned that
and extracted the text and graphics. I should be able to come up with
an ARC or ZIP soon that will include the original Epson-format file
(which didn't print right on my Star NX-10, but came out great on my
new Bubblejet), a plain text file, and a couple of graphics files
(probably encapsulated Postscript, possibly GIF, maybe both).

Finally, today I scanned the article on connecting a 1200xl keyboard
to other Atari 8-bits. I haven't been able to do much with the TIFFs
yet (*&$#@! Windows programs keep crashing even on a 16 meg dx2-66,
and there aren't any open Macs in this lab), but I plan on extracting
the text and cleaning up the graphics and tables a bit.

Again, I hope to have most of this stuff done by the end of the month.
In the meantime, I MAY put some preliminary files (TIFFs etc) on my
WWW page <http://www.cis.ohio-state.edu/~funk/> but that account is
scheduled to be temporarily deleted next week. I don't know when
they'll actually get around to deleting it, but I should have
everything back up around the first or second week of January.

Geez, those Commodore ads must be wild, considering that they are
out of business! However, I agree that Atari's ads, developer support,
etc. is pitiful.

Sounds like an XE Game System. This is similar in RAM & OS to an
800XL but with a few details like the Parallel Buss deleted and
a built in game <Missle Command?> added. GORF only works on an
800/400 or an XL/XE/GS with a modified Operating System. From what
I understand, there were also a number of upgrades for the machines
so you could do memory expansion etcetera, but I've never owned one
myself.

I think you may have me confused with somebody who is trying to make
money. The things came in TI cases with 2 full height 120 meg mfm
drives. My son has already taken the drives out of one case so it's
just sitting there with the controller/case/150 Watt power supply.
If you want to play with it, how about $20 for the works including
shipping? I don't know the status of the 5500 as I don't have a
scuzzy, but I assume it works & I'll garrentee the power supply
works & the case is a case<sic>. I forgot to check your address,
you are in the US right? I'd hate to have to pay for shipping
outside the US for $20.

> Ice-T...

Looks like you're in luck. Just last night, I found a program by Curtis Laser that'S called VT850. It emulates VT100 in simple text(ie. no page flipping, etc.). And it is XEP80 compatible. The unfortunate problems with it are...

i)It can't be used for IRC
ii)Supposedly no backspacing(strange...)
iii)XEP80's screen is too long and too wide, making it rather useless unless you're just using it to capture stuff.
iv)Help file isn't very helpful. It only tells you how to set up the program to work with an R: or T: handler. No actual commands are given. I found out that START+3 will give you a set up menu.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

Gorf pretty much sucks anyway. Your ship and most enemies are single colors.
(Gorf uses few colors anyway; plain 160x192 graphics would provide all the
needed colors, and be much more accurate.) The Galaxian stage is absent.
(Does _any_ Gorf port have a Galaxian stage?) And to make matters worse, many
enemies move in "curved" paths that are really diagonal lines followed by
vertical lines, mak- ing it impossible to dodge them when they fall since
since you can't predict how the path is going to continue. Finally, when you
die, it's sometimes possible to rematerialize right on top of an enemy and im-
mediately die again.

Hi there!

I was an Atari enthousiast back in 1983-84 and I miss my 800XL with all the great games I had back then. I'm willing to buy one but the problem is that I can't find any in France (they weren't very popular in this country, except that Club Med were using them for computer initiation in some of there villages).

Would any Atari reseller be interested in oversea shipping?

As a side note, my fav games were the Pitfall serie, The Last Starfighter, Alley Cat and Rescue on Fractalus.

>gooser. Dos XL is good, but I don't like the idea of constantly having t
>have the master diskette around to pick up overlays.

alSpartaDOS X also supports high-speed on the Indus GT.

alWasn't there a high-speed add-in module for DOS XL or something? I used
alDOS XL way back when, but I never saw the drive use the Synchromesh until
albought SDX.

Synchromesh Came with a special version of dosXL. Synchromesh downloaded a
programme to the indus to run at high speed. Indus does have high speed code
built into the rom but it is buggy and does not work. When SDX came out, Icd
added high speed ,code for the XF551. The high speed for the Indus is so
simillar that icd whould have added it also (I think). The only difference
between Indus and XF551 high speed is the baud rate for the data block. The
xf uses 39000 baud (approx) and the INDUS uses 69000 baud (approx) the
USD/happy etc uses 54000 baud (approx). As you can see The indus high speed
is faster.

Because The xf551 and Indus high speeds ARE so simillar, It is easy to add
indus High speed to SuperDOS.....

BlAtari started putting GTIA's in the 800/400 as early as '81. Mine had one

From what i have heard, PAL 800's never had a CTIA. GTIA was placed in PAL
machines to test it out then it went to NTSC.

>>circuitry.

>Anyone know what exactly this extra circuitry is?

ilThe 6502c has a HALT line, the R6502 and the R65C02 have not.

>Is the 6502C
>pin-compatible with the 6502?

ilIf I'm correct, the Sally CPU used in the XL/XE-line is the 6502c which i
ilnot pin-compatible with the R6502 or the R65C02.

The cpu used in PAL 800's xl/xe is an atari special 6502. It is the same
as a 6502 except for the halt line. That is why the standard off the shelf
6502 will not work. You must get the atari special one (part num CO14806)
for replacement. Early NTSC 800's used the standard 6502 with some extra
circuitry to disable the cpu while ANTIC required the data/address buses.
These can have the 65C02 installed. Latter 800's cannot. I found out the
hard way. As my system is PAL, I wanted to install a 65C02 in my 800. Pulled
out the processor board, found is was the atari special 6502. So i ordered a
NTSC processor board from best electronics Bassed on the sound theory that
it had a normal 6502 with the extra support circuitry. How wrong i was. The
only difference was the NTSC board had the NTSC ANTIC and GTIA and unused
space for GTIA color crystall. ARRRRRRRRRRRRGH.................

klOther big carts were stuff like LodeRunner where all the levels normally
klon disk were on cart, and Flight Simulator II which had all the scnery
klfiles on cart.

klAce of Aces used to require disk access to change perspective on its
klviews. This created annoying lag (not unlike the CD lag in 3dO crash and
klburn by the way ;)) but with the cart, this was ROM resident which makes
klthe game more playable!

klThe lowering prices of memory at this point facilitated this.

klIn fact I'd wager that MOST XEGS games were 64-128K using various
klschemes. I believe Crossbow and Crimebusters are big carts too.

Some cart sizes.

AIR BALL 64K
Flight simulator 128K
DEflector 64k
Ballblazer 32k
Rescue on fractulas 32k
Most others are 64k or less.

klThe same trend was happening in the 2600 and 7800 arenas. However, in
klthe case of the 2600 we are talking about 4K bank increments I believe as
klopposed to 16K on the 8-bit.

The XE Supercarts bank the lower 8k ie $8000,$9FFF. The upper 8k is the
controlling bank that does all the switching for the lower bank. The max
size of rom it can handle is 2 meg if you could get 2 meg rom chips (G)

"Historically Brewed: Our First Year" is a 100+ page trade paperback containing dozens of articles from "Historically Brewed", the magazine of computer history. These first editions are hot off the press and only $14.95 + $2.90 S/H (priority mail).
"HB" is published by the Historical Computer Society, an interesting and unique group with many fascinating stories to tell. Basically, to join HCS is to subscribe to the magazine. It is a small printed magazine (24 pgs), but filled with stories of the people and machines which changed our world. Issue #7 contains: "DEC's pdp-8, the first line of small computers", "For The Collector", "Calculating Machines", classic computer cartoons, lots o' letters, classifieds and more. It is sold in both of the computer museums here in the U.S. Subscriptions are $18 a year for six bimonthly issues or try an issue for only $2 (sorry, we are still too small to afford sending free samples). We do have over 200 members though, with some overseas. To purchase our book or to subscribe: HCS - 2962 Park Street #1 - Jacksonville, FL 32205. Please help us spread the word! Hope to hear from you! Best, David Greelish, HCS

Not in the 2600, 5200, Colecovision, or C-64 version.

My best guess is at some point Atari bought the right to the game
"Galaxian" which would have precluded Gorf from using that stage.

Can anyone confirm this?

Source record: 96433

The Atari cartridge port has lines which enable carts to be bank-selecting. Most of the OSS languages were 16k carts that occupied 8k of address space. SDX is 64k I believe, and Diamond GOS is 64k as well.

Dataque carries cartridge boards that will take a four megabit PROM - that's 512k - and map it into an 8k address space. The high 4k bank is always in memory, while the other 4k bank is soft-selectable.

Dave

I've got a diskfile of Gorf which works on the XL/XE's. I love the game myself. A matter of taste I suppose.

It is a pretty early game for the machines, from the 400/800 era, and one of the best of that era. Gr.15 would have been a waste of memory considering the fact they weren't doing much in the way of banked ROMs back then.

VT850 is garbage.

IT maxes out at 1200 baud :(

I didn't find any capture facilities either.

It also doesn't believe the XEP-80 has an ASCII font togglable, and uses
ATASCII as ASCII with obvious results with the ~ and ` and {} characters.

I have an Atari 800xl and 1050 drive that I know work that I would like to either sale for best offer by Dec. 16th, or I'll trade it if someone out there has some old (I know, this is gonna sound crazy:)) Transformers toys in good shape that they want to get rid of. If you want to trade, they have to from the original line, not the re-issues that have been on the shelves since 1993.

The 800XL is in good shape, excect that it needs a new RF cable. Includes power supply. The 1050 drive has been refurbished, but works fine. Includes powers supply and I/O cable. I would prefer to get rid of it as a set, but will part the two if necessary.

Thanks!

Eric Harding

There are a lot of Atari related programs on "archive.umich.edu". There
are also a lot of files on Compuserve's Atari forums. You should be able
to find the programs you need there.

I tried Boulderdash first on PC Xformer 2.5, and it worked fine. You have
to use the keys in place of a joystick because ver. 2.5 only supports
joystick emulation using the keyboard. I have since purchased ver. 3.0
and the joystick works with the game. Version 3.0 claims to have sound
support but I have not yet found a game that it works well with, so don't
count on sound.

I don't know if there is a FAQ or compatability list, but if there is it
is probably at the "archive.umich.edu" site.

Rick,

To be honest, I used to say the same kinds of things you are saying now.

That was before I started using the Amiga.

Now, there is no way I would ever be without multitasking. The uses are so varied, and many of them so subtle, it's not easy to list them all. Suffice it to say that I rarely have less than 3-4 programs running on my amiga at any one time.

I don't know whether you have ever had a very nice multitasking machine for an extended period of time. Many of the habits I have now didn't develop until a year or more after I started with the Amiga. And I'm still learning new things. I can make a few generalizations here.

First, you _never_ have to stop what you are doing to do something else. Multitasking is like freedom. The machine will always be available for use, no matter what else is going on. It's a flexibility and an increase in productivity that you just won't be aware of until you're used to it.

Data sharing between programs in real-time. Many combinations of programs work extremely well together. And they can't share data efficiently if they aren't running at the same time.

Let's say a program needs to edit some text. Instead of every such program needing to provide text editing capabilities, they can just pass the task off to another editor program. This makes less work for the programmers, makes things more efficient, and the user gets to use _his_ choice for what text editor to use, and the same editor for most tasks.

I run a program that monitors a real-time stock data feed. Were I to not have multitasking, I would lose the use of my computer for the whole business day! Actually, this is a Macintosh program that runs on an emulator. So I'm actually running a Mac in the background of my Amiga most of the time. (I can share data between Mac/Amiga programs too.)

A friend of mine was installing a new program he just bought. It was copying and decompressing files from floppies. Instead of having to wait for this, I loaded a program I had brought to show him, which was a 3D radio controlled plane/helicopter program. (A cool product btw with a real Futaba box interface.) On the Amiga, disk I/O takes almost zero CPU time, and we were able to play the game with very little degradation. This was on an Amiga 500, with 2 meg of ram, (would have still worked in one meg), a 7 MHz 68000 CPU, and no hard drive. There isn't any other OS in existance that will effectively multitask on resources like that.

>the case. I have heard of two purposes for it. One was that it was
>a test connector, the other is that it was a high spped disk i/o
>port that Atari decided that noone needed or would use. Anyone
>know anything?!

I've heard it's called a "pig-tail" and was used for testing. I've
also heard it is only on early 800s. BTW, when did they change from
brown to beige cases?

As to alternate interfaces, they had some ideas.. Here are some
statements from Doug Neubauer, from an interview with Lee H. Pappas
in ANALOG:

LP: Can you give us a quick history of how the POKEY chip first came
to be?

DN: The Atari 800's architecture evolved as an upgrade of the 2600.
Conceived primarily by Steve Mayer, Joe Decuir and Jay Miner
before I arrived at Atari, the original plan for the POKEY chip
called for keyboard interface, audio and paddle controllers.

After I did an initial estimate of the size of the chip, we found
that it would be possible to add a serial port for communication
with a tape cassette recorder. Also, I added some enhancements to
the audio, which was originally planned to have the same audio as
is on the 2600.

LP: Were there any features you would have liked to include in the
POKEY chip that were never implemented? If so, what were they, and
why didn't they get in?

DN: The main problem, I think, with the Atari 800 is that all I/O is
serial. Originally, the POKEY's serial port was intended to talk
only to the cassette recorder. Communication to floppies and
printers was to be through a parallel port and extension box.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Unfortunately, the parallel port was abandoned (there was a fear
of RFI and the difficulty of getting FCC approval) and all I/O was
fed through the serial port.

This is why it takes so long to load a program from floppy disks;
it's all running through a 48K-baud serial port. With hindsight, we
should have at least added a couple more serial ports and broken up

some of the I/O functions.

Could that be related to the 'edge connector'?

Source record: 96446

A few thoughts from here and there:

To upgrade an Atari 400 to 48k, contact BEST Electroncs - they've got memory boards for about $30 I believe. Address:

Best Electronics
2021 The Alameda Suite 290
San Jose CA 95126-1127
(408) 243-6950
Fax (408) 243-8274

CardStax: I'll be sending it up to UMich this week.

Extra RAM handlers for Diamond: The linear mapping isn't really all that good; all the software really does is provide a standardized interface for using any RAM expansion. All Diamond MOVE routines take a 4-byte address; there are specific routines for swapping memory as well.

Dave

Oh, if a man tried to take his time on Earth

>=-=-=-=-= Internet: miles@cc.usu.edu =-=-= Bitnet: miles@usu =-=-=-=-=
> Spell check a flame? Shirley Hugh Chest!

The power supply for the XL/XE line is a 5v DC supply. The connector is a 7
pin DIN connector with pins 1-4-6 at +5v and pins 3-5-7 at GND. I used a 5
pin DIN connector and a linear 5v power supply to make my own when the
original bricks went up in smoke. The pin are all ganged, so you really only
need to connect one of the lines.

Going clockwise looking at the connector on the power supply starting at lower
left the pins are: 2
5 4
3 1
7 6

The 5 pin DIN will only have the top 5 pins, ignore #s 6 & 7.

Hope this helps.

>I have heard that hardware flow control is now available for the original
>MIO at the RS232 port. Is this true? And if so, how is it done??

>I know that the stock MIO did not have hardware flow control.

According to my MIO manual, pg 7:
"Full hardware handshaking is supported from this connector and with the built
in "R:" handler. The signals listed in table 2-2 are supported by the MIO."

Running Bobterm at 19.2k I don't have any problems, and when I ran The Atari
Scene under Pro! with a Hayes 14.4, I had no problems. The only problem was
that the BBS program couldn't deliver data fast enough to make the speed
effective. Downloads were limited to around 900cps when using Ymodem-G.
When using Bobterm, I transfer at rates of around 1800cps using text files to
my PC using the MIO's port.

When trying to use a 14.4 modem on either my TI or AppleII I had to disable
hardware handshaking and rely on XON/XOFF only. The TI program buffered up to
20K of incoming data, giving priority to the serial port, and updating the
display as time was available. No characters were lost but the display was
updating like a 2400 baud rate.

When using IceT or FlickerTerm, I lose characters at anything above about
4800bps. I don't know if this is a buffer/display problem or not.

BTW, the same thing will happen on a PC if you use a poorly written term
program on a slow machine and try to run 14.4.

VT850 is only useful on an XEP80, otherwise it uses one of those
scrollable 40 column gr.0 screens.

It also can't keep up at even 2400 bps.

> i)It can't be used for IRC

Why not? Is there an emulation problem?

> ii)Supposedly no backspacing(strange...)

I never had a problem there. Control-h is a good trick on many systems.

> iii)XEP80's screen is too long and too wide, making it rather useless
> unless you're just using it to capture stuff.

? The XEP80 is 80x24, plus an extra status row. Same size as any other
decent VT100 emulator.

> iv)Help file isn't very helpful. It only tells you how to set up the

It does tell you how to register the program, which for me resulted in a
nice lase-printer manual.

I never did get the capture function to work, though.

Since I suspect most readers here haven't noticed yet, I thought I'd point out we have another new Atari computer newsgroup, called comp.sys.atari.programmer. This is supposed to be for topics in programming both the 8-bit and the ST/TT/Falcon platforms, despite the fact that they nearly completely ignored comp.sys.atari.8bit during the creation process.

I'd personally like to see both comp.sys.atari.programmer and comp.sys.atari.announce overwhelmed with 8-bit topics, just to spite those who would say the ST/TT/Falcon is "the" Atari computer...

Not really, when you consider that the ST's GEM used a similar
resolution to the 8-bit's graphics mode 8 in low-res. Besides, the
windows are only really likely to be used for serious applications
such as DTP which won't need very many colours.

Already under consideration. Hopefully we'll be able to come up with
an MMU that will detect several upgrades and treat the extra RAM as

one continuous block of memory.

Talking of banked cartridges, Atari did produce limited numbers of a very special cartridge for use in Shop (Store if you prefer) demonstrations.

It was called the XE DEMO CARTRIDGE (it worked on the XLs as well!) and had four different games on it. To switch to the next game you turned your computer off, waited 5 seconds then turned it on again and the next game would appear!! Very clever stuff, I don't know how they did it.

The games were Joust, One On One, Ms Pac-Man and a non-playable demo version of Flight Simulator II, bit of a cop-out really, it would have been great if they had included the full version of FS II!!!!!!!

They were produced in limited numbers and didn't have a box or manual but still they are certainly unique.

Gorf was also available on disk and requires a Translator disk to run on a XL/XE computer.

Whats all this about the XEGS having two in-built games?? As far as I am aware it only had one built in game and that was a modified Missile Command. It also had BASIC built in. The boot procedure for each ROM component varied depending whether or not the keyboard was plugged in. Also the UK version (and possibly the US version) could look for the START key as an alternative to the Return key during the cassette boot procedure. This was apparently added after a last minute plea by ATARI UK, so owners without the keyboard could still be able to use the cassette based software which was very popular at the time in the UK!

Wrong. If you call Supervisor(ptr) then exec.library will enter supervisor
mode and call func.

But John, I put you in the same catagory as Wilkinson. You are
probably one in a thousand if not one in a million. I guess my
point is people seem to be trying to say multitasking is required
or at least highly desirable for computers in general. I know
or should say come in contact with 300-400 people that use
computers on a daily basis & virtually none of them need or use
multitasking. They don't even use print spoolers! If they have a
long print out they just get it started & walk away from the
computer to do something else. The print out means it's a done
deal as far as their computer use for the day is concerned. Until
the advent of laser printers even the secretaries had to sit there
feeding sheets by hand. The concepts people are talking about are
so specialized i.e. downloading a picture & viewing it while still on line
is not what your average user needs. Matter of fact, the Info Science
people took away ALL the modems & outside lines from the computers &
replaced it with a LAN just to keep this kind of BS from happening.
For better or worse, most businesses seem to be going the LAN route
so the concept of a virus just scares the s**t out of them.
The argument I'm making is the moral equivalent of Ben's statements
when people say most users are online. He just comes in & says that
75% are not. Maybe [programmers, computer artist, desk top publishing,
the self employed] can use multitasking, but they should realize they
are in the extreme minority.

7242. Re: multitasking - 6502?

BTW John, I'm sure you could do a form of multitasking on the Atari
IF you wanted to. Something like word processing on terminals
hooked up to 2 or 3 serial ports on the PBI? Maybe I over estimate
your talents, but I'd bet you could knock something like that out
in an weekend.
Rick

Talking about Star Raiders, it was the game that had me totally stunned for about 4 years. I still have a fixation on 3d star demos. Maybe, just as a dedication to the programmers of star raiders in 1979, a real second version could be done.

Overall game play should not be changed. We don't need extensive maps etc. Just different algorithms for smooth star scrolls etc. Focussing on what can be done on the atari. A tribute to the designers of the XL and star raiders.

If anyone is interested, I still have a nice star scroll which uses vector addition (should be used in a demo which was never published) and is able to produce 127 stars/frame. No rotation though.

Come on, some of us must have some spare time left...

Multitasking can be done on a 6502 without *ANY* problems.

Err, that is, when the programs that should be run are programmed
according to certain rules.

Programs have to follow rules because the 6502 doesn't have :

- memory protection
- privileged instruction protection

Dispatching can be done in quite an elegant way though, and some
sort of applications, also for the 8-bitter, can benefit from
it. I will soon post an article I wrote (merely an inventarisation I
did with a book next to my XL) for Mega Megazine a while ago. Hmm
I wonder what is wrong with the previous sentence.

>Now, for the question. What kind of XE is this?

It is the "ATARI XE Video Game System". - A special version to push
sales of the Atari XE by selling it "under cover" as a game machine.
(The box says: "The ultimate system for the advanced game player.")

According to the flyer I got from Atari Germany (dated 2/88) the
technical specifications don't differ from the normal Atari XE.

So long

I mean the XEP80 screen is too long(ie. same number of lines, but it
doesn't fit on the screen. And I don't have any v-height knob on this
stupid 1702 monitor. I wish my 1802 still worked)

Try SELECT+2 to turn capture on. You have to have a file set up in the
menu(SELECT+3) first, though.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

: C=64) compare?

The 7800 has 16 graphics modes, 256 colors (up to 25 on screen at
once), can handle 64 on screen sprite without flickering as well as a
bunch of other things. I've never seen a C65, so I can't compare them.

I was transferring a few files to my PC the other night & I noticed what has to be a bug in the copy of MyDOS that comes with SIO2PC. I know a few other people seem to have problems also. I was transferring a single density disk from a 1050 as D1:, a SIO2PC ramdisk as D2:. When doing a duplicate disk <J from the MyDOS menu> the transfer went right for the 1st 400 or so sectors. When MyDOS finished reading the pass that included sector 720 it tried to write sector 721 & 722 to D2:. This caused a error 139 I believe. I've not sure why the bug doesn't happen with a regular drive, it may but I haven't checked it out yet. It's not so much a problem as an annoyance for me since I have other duplicate disk programs. For the most part, transfers seem to go OK from DOS 2.5 & my programs. Anyway, if someone can pass this on to Bob Puff or any other keeper of the code so they can double check the source it would be appreciated. One other minor, the XF 2.5 contains a file MYDOS45D.ATR, this file boots fine on the emulator, but doesn't seem to work with SIO2PC. The file does have the standard .ATR 16 byte header, but I'm assuming it should really be named something else i.e. MYDOS45D.XFD or patched so it will work like an .ATR disk. As it is, it seems to keep changing the serial buss ID to D8: during a boot. This would've saved more then a few minutes of my time. I tried patching it by replacing the boot sectors which worked fine for running it on a real Atari, but the resulting file crashed with the emulator. While I'm getting on the emulator's case I might as well add one more nag. I figured no sound, no collision detection, fine! I'll just try to run Ultima III. After the program boots it prompts you to insert side 2 of the disk. The docs that came with the program don't say how you can emulate a 2nd stage load from a program that insist on only one drive. I'm assuming it can't be done with existing versions. Rick

: or should say come in contact with 300-400 people that use
: computers on a daily basis & virtually none of them need or use

To whit I would say that there are something like 20 million internet users.

That's a hell of a lot of people spending a long time online. Not to mention probably greater numbers of users of general purpose BBSs...

If you concede that the most common form of obvious multitasking is during downloads, then that's a huge number of people who would probably love the benefit if they don't already have it.

I am not saying everyone needs it, but it doesn't take a guru like John to appreciate or learn multitasking.

It took me, at the most, a few hours to learn the ropes of the Workbench. Where before I would tie up my internet provider with dead time while I would load pics into JviewXL from the hard drive, now I can process pictures in the middle of downloads.

The one thing that DOESN'T tend to multitask well on the Amiga is games. So unless you run a lame Workbench window game like Tetris, it will wipe out the terminal.

Some Animations also want to take over the machine sometimes.

But most anything else will work okay.

--

How about true parallel processing? There are some rough edges in the MUX, granted, but one thing it does have is pipes. These are PHYSICAL pipes between machines. These could very well act as an implementation of REXX ports.

If you had an 8 slave MUX, with the right software, you could have 8 huge programs working together as one. Or several programs communicating with each other.

The performance of such a multiCPU machine would be respectable enough to warrant following the project through. Far more powerful than timesharing a single 1.79mhz CPU.

It just doesn't come cheap with the MUX...

To date the only programs that use MUX pipes are Bob's infrequently used multiline chat on his board, and the multiline chat of multiline PRO!.

Or you could take a cue from the Amiga and try to interface the Atari with a dissimilar CPU. There was talk at one time of hacking a 68881 FPU or DSP to the 8-bit through the PBI for instance.

: Well.. not many games used the pokey chip... and now you are asking
: them to include 1 in every 7800 system...whether it needs it or not..

Not many games used the Pokey chip because it was an added
expense physically and with development time. Not many games used the
Pokey chip because it wasn't a standard part of the archetecture, but a
passthrough could have chaned that, hence, most games could have then
supported it because they are counting on it being there.

If you chalk up part of the failure of the 7800 on its poor
sound, then investing in a passthrough Pokey on all new 7800s is a smart
move. If you manufactured 5 different games with Pokey onboard, and made
enough to be able to sell to all 7800 owners, you've already made many
times more than you would have had to make had you just put it in the box
with the console.

Atari, and yes, even Nintendo, were thinking of the short term by
putting coprocessors on the carts. If they thought longterm, they would
have been able to encourage developers all to use it, and the level of
the games would increase, thus bringing in more sales. It is a win-win
scenario.

Since Atari itself was the one responsible for creating most of
the 7800 games, whether firmware would support the passthrough Pokey was
all up to them. They didn't have to do much convincing to 3rd parties.
All that would be needed would be an edict: all games from now on will
use Pokey, or use pokey and RIOT (6 voices, woo hoo!). And that's it.

The reason I say passthrough Pokey rather than a motherboard
revision is that no user is going to have a clue whether they have a 1984
or latter revision machine. Some stupid 12 year old won't bother to
check for the expansion port, etc.. It is easier to have ALL users plug
in a passthrough than to label the new consoles "NEW POKEY SOUND ONBOARD"
which would just lead to confusion... Those who bought a 1984 unit would
be able to get passthroughs as standalones, but they would be in the BOX
with all new 7800s.

That's me, armchair executive, but I think it would have worked great.

: resolution to the 8-bit's graphics mode 8 in low-res. Besides, the
: windows are only really likely to be used for serious applications
: such as DTP which won't need very many colours.

Well, I've tried the Amiga Workbench at 320x200 and 1 bitplane. It is BRUTAL. It's not even enough space to open 2 windows on the same scanline without feeling cramped. The best you can do is split them top and bottom or something. Everything is cut off.

If you work with blit 8 instead of Gr.0 you will have to work with Itay to see if you can speed up blits enough. Gr.0 is too coarse, but Gr.8 is too slow. No win situation.

Also, when moving or resizing windows, you can try blitting only an outline of the window rather than the whole window. That's how the Amiga does it to quicken it up.

Of course, you could have a VIRTUAL workbench and allow scrolling via the mouse. Maybe a 640x200 virtual workbench... Take advantage of hardware scrolling, dude.

: >
: > I think you could probably extend a command line system into something
: > more task oriented ala Unix...

: Hmmm ...

Consider the Amiga again. Since we are talking crowded here, opening 'custom screens' is a must. You might have trouble allocating screen memory, I guess you could swap to disk or something, if you use ANTIC BANKING as your 'chip ram' ala the Amiga for multiple screen storage, you will be locked in Antic banking which will lock out the CPU from using the banked memory as contiguous. So you could try to kluge it by using 'cpu and antic see extended ram' mode.

Only if you have an 800x600 mode do you have enough resolution to be able to open a lot of windows at once and not have them stacked up like cards on top of eachother. Even when I chose 640x400 interlaced, after I open a directory with a lot of files, it's cramped because not all the icons will fit, not by a longshot. It's in cases like that where a CLI is so much faster, or even a graphical MENU ala SDX or SD diskbased menus.

There are times when using a shell is more direct and therefore faster than using a GUI.

In the Amiga, the workbench is where you launch programs, but you can always switch back to it to do file maintenance or launch new programs when one is running by using a global hotkey built into the OS kinda like how Snapshot patches a hotkey as best it can to the system. If the Atari GUI is nothing more than a fancy way to launch single tasks, I fail to see how it would be in any way more productive than a command line interface. Just bear that in mind. GUIs and multitasking go hand in hand.

There is a cost-benefit argument here. If the GUI takes up 16K of RAM and introduces a heck of a lot of incompatibilities with existing programs, all you are gaining is a fancy interface and you are losing compatibility. That was the problem with most of the Atari GUIs... There is almost no room for DOSs or OS overlays to hide on the Atari. SpartaDOS X already does so many tricks with memory management it's AMAZING it gets away with what it does and that is just a simple MS-DOS ripoff. And we all know that Diskbased Sparta is incompaible with a few good programs that make proper use of the 'missing 16K' of RAM. Banked ROM and protected BANKED RAM are the last safe places to hide this kind of stuff.

The more I think of it, the more something like a Directory Opus style program on the Atari would be IDEAL as the perfect interface. Essentially a glorified configurable point and click SpartaX style menu.

: Already under consideration. Hopefully we'll be able to come up with
: an MMU that will detect several upgrades and treat the extra RAM as
: one continuous block of memory.

This is our last best hope - for new and better applications.

The problem here, as I see it, is that computers have nearly reached the point of being "applicances," i.e. something that Joe User buys without technical input, brings home, plugs in, and uses without knowing much if anything about "how it works." This is the way Unix and MSDOS have captured so much of the world, namely, the overwhelming majority of their users are the type who simply take for granted that The Way It's Done Right Now isn't the Only Way It Could Ever Possibly be done. The thought that computers ought not to crash now and then for no reason, or that you ought not have to manually edit cryptic configuration files when installing new software, or that you ought to be able to run several things simultaneously without any "special" programming, NEVER ENTERS THEIR HEADS. They will still buy machines that DON'T have those capabilities, and the manufacturers will see that they can SELL machines without having to expend energy to develop those capabilities, and the industry will continue to crank out mediocre computers to the masses while the truly advanced machines languish. This is pretty much true in EVERY new technology: when the technology is first developed, only the technically-inclined have it (home computers; CD players; FM radio and TV back when they were new!) and there are lots of different options and there's a knob to adjust every conceivable aspect of the device's operation because nobody knows which features will turn out to be "set-and-forget," and which will not -- and the primary users want to be able to customize behavior anyway. As the technology matures and an ever-greater number of less informed users clamber aboard the bandwagon, a greater and greater percentage of the user community understands less and less about the equipment and want to just plug it in and forget it. Knobs disappear, oddball third-party brands that had too many knobs that didn't catch on disappear, and a "standard" appliance takes shape. There's no real reason for things to be the way they are, except for the accidents of history. If the first home computers sold had had true multitasking (by whatever quirk of history that might've happened), no one would ever have considered creating a NON multi-tasking machine as a cheap alternative, simply because multi-tasking would be ingrained in everybody's mind as a "vital" feature of the system. But non-multitasking computers caught on BEFORE true-multitasking systems were able to carve out a big enough niche; Amiga jumped a mighty jump but didn't quite get over the hurdle, sad as it makes me (an Amiga afficionado myself) to see/say it. My observations strongly suggest that the mediocre machine always wins out, whether in terms of market share, public image, or what. It may or may not have been P.T. Barnum who said, "nobody ever went broke underestimating the intelligence of the public." For intelligence, I often substitute "taste" with no loss of truth...

Why not simply bank-switch page zero among several physical hunks of RAM, using a selection register located elsewhere? That ought not to be too darned difficult and it'd be fast. Do the same thing with the stack page, and maybe a third page for storing "process context," and you'd be in business, using technology which, God knows, is "tried and true" on the Atari.

Heck, while we're at it, why not simply bank-switch the whole darned 64K memory space, under the control of a small timer-interrupt-driven scheduler routine? Reserve, what, eight or ten bytes somewhere to save old process context and a little for the scheduler routine, and voila! I'll bet Ben Poehland could cobble up something like this out of three or four spare Atari's in a weekend or two. :-)

No, it's that those who are good at marketing, usually aren't creative hackers.

And the reverse is true as well. Bushnell was an exception and he got out when the getting was good. However, the 2600 almost sold itself by virtue of it being the best thing around and one of the ONLY things around for a few years so that was a unique situation.

The bean-counters are the first to call for software or hardware compromises, Tramiel being one of the biggest offenders. Lest we forget that the ST uses a disk FMS which is practically identical to MS-DOS. Innovator Tramiel was not, however nonconformist the ST appeared on the outside.

The sad thing is that a shithead like Bill Gates is lauded as a GOD of programming and having become king by virtue of an underdog beats-the-odds struggle when his greatest marketing triumph was a combination of plagiarism from CP/M and luck dealing with IBM to become the official OS of the IBM-PC--and Bill Gates himself probably hasn't written a line of code since 1983. Not to mention his 2nd biggest triumph being a johnny-come-lately ripoff of the MAC GUI, which was in turn a ripoff of the Xerox systems--but that's another story.

7278. Trouble with corrupted files?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-10 01:35:47 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <3cb0lj$kle@usenet.INS.CWRU.Edu>
Source record: 96503

I've been having some inconsistent
file transfers using 'Util' on my
IBM XT clone. I know the files can
be wrong going from IBM to Atari
and there seems to be nothing I can
do to predict the outcome of a
'Util' write.
I wrote a crc16 program to get a
crc16 value for files on the Atari
a few weeks back, because I was
having some other 'corruption'
problem. My Atari crc16 doesn't
match the crc16 program I already
had for my IBM. So, I wrote a
Turbo Pascal crc16 program for the
IBM that gives the same results as
the Atari.
I already uploaded crc16v10.arc
to umich archive. And I will be
glad to send crc16.com for the IBM
to anyone interested.
It is interesting to note that
the ACTION! crc16 is about 8 times
as fast as my IBM crc16. (Or
should I say 8 times less slower?)
I was working on Unshrink for
the Atari 8-bit Unzipper. I was
testing a zip file that just
wouldn't work right. I finally
re-did the 'Util' transfer and it
turns out the zip file I had
transferred to the Atari was
corrupted. There was nothing wrong
with my Unshrinker, just the zip
file was messed up by 'Util'. (I
still use 'Util', it's a lot
quicker than setting up a null
modem and I don't want to mess with
permanent SIO2PC cables.)

>edge.

Also true, but Atari Inc. insisted on an encrytion code because they
wanted control of development (didn't want a repeat of the VCS
crash). Atari Corp. tried to make the algorithms public, because
at that point they wanted any developers they could find.

That's why there is a pause when starting a 7800 game. The system
is calculating some kind of checksum to compare with the
encryption code.

: I don't think it's encryption. The 7800 carts have more pins on the card
: edge.

It is encryption. 128 or 256 bytes of header info I believe.
I believe you could just as well write a 4K 7800 game using none of the
extra pins.

The encryption was done to hinder 3rd parties from releasing games
without dealing with Atari first, which is why there are only a couple
3rd party games for the 7800. But Nintendo did the same thing so it
isn't that alien of a concept.

The encryption key code is lost, by the way, due to the usual Tramiel idiocy.

Ali of C= may take the cake for being an unequivocal asshole, stealing
from his company to line his pockets, then run off like a coward when the
creditors came calling. He is now bunking with Salman Rushdie I hear,
but the Tramiel family has almost bent over backwards to piss of 8-bit
and game system fans, and continue to screw up to this day with the
Jaguar despite what is probably their best and final gamble.

It's more accurate to say "Commodore UK and Canada are surviving, somehow.
That's about it."

Commodore US liquidated in September. Commodore International is still in
liquidation. One of the two companies which seems to be trying to buy the C=
assets (the Amiga, basically) is C= UK.

It's hard to characterize C= UK or Canada as strong, as they have no real new
product to sell...

>are in the extreme minority.

I agree with you.
At my place of employment, every computer is connected to the
LAN. Every computer also runs Windows. Almost everyone there has
more than one program loaded at a time. But no one actually
multitasks. What I mean by this is that no one ever actually
has more than one process running at a time. When the benefits
coordinator recalculates her 28 MB spreadhseet, she walks away and
has a chat with coworkers. She doesn't flip to E-mail and star
er, start reading her messages. I doubt that she would be happier
if she did.
Similarly, people go grab a coke or snack or spend time
talking while their WordPerfect merges are running.
I agree that those who actually use multitasking are in
the minority.

I just have a quibble here. The 2600 wasn't alone in the
market by any means (Bally's Astrocade, Odyssey 2, and the Channel
F for example) when it was introduced. It was also not the best
thing around (although "best" is a subjective term), as witness
Bally's machine.
But you are right..Bushnell got out at the right time.
Entrepreneurs almost never make good managers, simply because the
traits that make one a successful entrepreneur are not those that
make one a good manager. It would have been interesting to see
what would have happened had Warner not put in their own guys and
Bushnell had stayed on. Or if he'd never had to seek capital in
the first place. But, I think the company would have crashed
and burned even before it did under Warner.

Heh. Bill gates - the man we love to hate. :) A real-life
J.R. Ewing. [Grin]
He made his name writing BASIC interpreters for any machine
that would have him. Thank the Lord that Atari didn't ask him to
write their OS and/or BASIC, and instead turned to Shepardson Microsystems
Inc. for both. The Atari could have turned out to be a very different
machine.... (oop...meant DOS, not Os. The Os was written by Atari,
of course!)
The entire world pays for Bill's company's mistakes every day....

>Who else noticed that MULE for the C64 used Atari's built-in
>type font?

I did. Looked like the same program to me. Didn't the Atari {4|8}00
and the C64 actually have the same processor?

>How do you play MULE with more than one player on a C64? (or for
>that matter an Atari XL or XE?)

For the trading phases, two on joystick and two on keyboard. For
the land grab, keyboard and joysticks. For M*U*L*E placemenrt, yoyu
gram ab avaliable joystick and hit the button to tell the CPU who to
listen to. I still have a copy and a C64 :-)

>Has anyone ported MULE to the PC yet?

I hope not, in a way. They would mess it up, and I don't think
they could make the graphics as simple.
I actually tried to play the NES version once. It was painfull.

7286. Wanted: XMM801 "dust Cover"

I too have seen this and have wondered about it's possibilities. Anyone out there know what this is? If i read my hardware manual correctly it does indeed seem to be a test connector. It also seems to have all the data and address lines connected, in fact most of the cart lines seem to be connected. What gives?

Atari 8-bit wantlist

Looking for 1 each of the following games, cartridge or disk,
preferably with docs, for the 800/XL/XE. Also interested in
5200 versions of some titles. Titles with a "?" I need info
about what they are. Thanks!

800/XL/XE - must have docs!

Battlezone
Beamrider ?
Blue Max - need docs!
Burgertime
Creepy Corridors ?
Crossbow ?
Crossfire ?
Dark Crystal ?
Frogger II
Gateway to Apshai ?
Gemstone Warrior
Gyruss
Kangaroo
Legionnaire ?
Mario Bros.
Marble Madness ?
Montezuma's Revenge ?
Moonsweeper
Moon Patrol
Mousetrap
Mr. Do!
Phantasie I-II ?
Phoenix - arcade
Pitfall II
Q*Bert's Qubes!
Serpentine ?
Spindizzy ?
Star Raiders II - cart version
Time Pilot
Tutankham
Vanguard
Venture - arcade
Xevious

Mac/65 or any good popular macro assembler.
Prefer one useable on 64K machine. (stock 800XL)

Atari 5200 - must have docs!

Montezuma's Revenge ?
Moonsweeper
Mr. Do!
Tutankham
Xevious

Atari 2600 - must include docs!

Dark Chambers
Frogger
Moonsweeper
Pengo
SwordQuest - Waterworld?
Solaris - need docs!
Yar's Revenge
Zaxxon

If anyone has anything to offer, please email!

Message-ID: <199412101352.AA117247546@relay2.geis.com>
Source record: 96372

I've been looking at Diamond GOS for a while now; it's quite interesting. It includes memory management routines. The intent was to make RAM banking transparent to the programmer - it maps any expanded memory into a pseudo 32 bit address space by using RAM expansion handlers.

I think any "windows" for the 8-bit has to support both text and graphics modes. You just can't get adequate speed when every image being manipulated is bit graphics. For a paint program, DTP, or WP preview graphics 8 is fine. But for a desktop or word processor you've GOT to have a text mode to get good speed. Analog once published a routine for windows in graphics 0; I had it running in graphics 8 as well, since both are 40 bytes wide. My version used a single calling address, and checked the number of arguments to know whether to open or close.

I'd be glad to help out with an 8-bit Windows project; I write with Mac65 (disk version), under Sparta 3.2gx.

Hmmm..."horses for courses" - I am writing this email on a Macintosh
Quadra 610, I have a music CD in the CD-ROM drive playing (ABC and D....by
Blue Bamboo) in the background (not difficult, obviously, but the Mac is
keeping track of the volume, and which track is playing), I have also
previously opened 5 copies of my FTP program and downloaded 5 files at
once, whilst downloading another 2 or 3 in a World Wide Web browser, with
my LAN email program checking mail (it's just told me another mail has
come in).

When a PC user saw me doing all this, he got jealous, and now uses a Mac
for Internet access, but I suppose most new machines (PC {with a decent
OS}, Mac, RISC) can multitask in this way. I've taken it for granted since
Multifinder came out (pre-1990? - there's a history of Apple in this
month's Byte but it's at home).

HOWEVER when I get home, although I have a Mac SE in my 'den', I can't
play Rainbow Walker, Rescue on Fractalus or DropZone on it, and I can't
program it as I didn't learn HyperCard, which I thought was too slow to
bother with (I'm working with a software project using David Deaven's
Infra Red Gateway hardware and software on my Atari), and I can't hook it
up to a TV to use it functionally with the IRG, and I can't easily hook up
a PC or Mac to my hi-fi in another room (can't be bothered to move all the
kit around).
Also, my 130XE with SpartaDOS and a hi-speed drive takes 9 seconds to boot
it's OS and into my program....I needn't go on, horses for course.....if I
wanted to, I could link my Atari into the Internet, but I couldn't use it
on the World Wide Web etc. etc.

Even if I could multitask my Atari, I probably wouldn't want the slowdown
and/or loss of memory, and/or crashes with incompatible software -- it
just wasn't meant to be.

Sorry, rambled a bit there.

Atari 8-Bit Stuff for sale:

(NOTE: The prices below are for individual items,

See SUPER PACKAGE DEAL at the end of this ad.)

HARDWARE:

Reset Button: Plugs into cartridge slot, $10.

SOFTWARE:

* Pilot Programming Language

w/"Turtle" graphics, (Educators'

package), $10.

* Sublogic FLIGHT SIMULATOR 2 plus JAPAN SCENERY Disk, $25.

* Timewise (Time management), $9.

* "Kingdom" (Instructions and

game, cassette), $3.

* "Biorhythms", (Instructions and

game, cassette), $3.

* "Super-Text" word processor

(disk), $4.

* "Atariwriter" (Cartridge), 2 avail., $20. each.

Excellent word processor for Atari

* "The Newsroom" (Compose and print newsletters) $10.

* "Movie Maker" (Animation Construction Set) $10.

* "Your Personal Net Worth", $10.

* "Softporn Adventure", $5.

** The following from XLEnt Software, $15 each, or all 5 for $65.:

(A full desktop publishing sytem for the 8-bit Atari)

a)Megafont II

b)The First XLEnt Word Processor

c)Rubber Stamp

d)Typesetter

e)Page Designer

* Atari BASIC version "C" cartridge. Eliminates bugs in built-in version "B".

BOOKS ($3.95 each plus shipping)

Atari Programming (with 35 Programs)

An Atari in the Classroom

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY

SHIPPING ON ALL ORDERS OVER $35.

All these prices are negotiable. I am especially receptive to package

offers that move a lot of items!

****SPECIAL BARGAIN OFFER****: The items above total more than $200.

IF YOU TAKE EVERYTHING---$75. postpaid.

Please reply by e-mail.

Source record: 96383

Glen, your still assuming everyone on the Internet D/Ls stuff. I've D/L'd
less then 1 meg in the last year & 1/2 of that was at someone elses request.
At 14k you can get a through put of about 1k bytes/sec right?
=>60K/minute
=>36000/hour
=>I've used less then 3 hours in the last year transfering files.
Am I supposed to be impressed that if I had used multitasking I could
have spent one of those hours decompressing & testing the files? Let's
see what I could have done with the extra time... read 1/4 of a book, drive
about a 40 mile round trip with no stops, watch another hour of TV?
Nobody cares! The way you guys are saying you D/L is not the way anybody
I know does it. What happens is they hear about one file, they D/L that
file then immediately start playing with it. If Ben's numbers are correct,
75% of the people with computers probably download nothing since they
don't even own a modem. It's a sure bet that if they don't own a modem
they don't need a fax program running in the background. For you multitasking
may be the greatest thing since sliced bread, but I think we're going to have
to aggree to disaggree on this one. I would even venture to guess that
down loaded software is going to take up an even smaller portion of
hard drive space as CD ROMs become more popular. For instance, why should
I spend 100's of hours online when for $20 I can get 680 megabytes of
C source code on a CD ROM? I just bought a 10 pack CD ROM sampler for $20,
I'll assume they're not each full, so how about 5 billion bytes of files
& a Diet Coke from Fry's in 10 minutes? If someone ask me which should
do, get a $50 CD ROM drive or a $50 14k modem I would probably tell
them to go for the CD ROM unless they really wanted to listen to the
witty repartee like you find here<g>.

Russ, have you been setting the binary flag for all the transfers?
Reason I ask is it gave me a world of trouble. If I recall correctly
UTIL defaults to non binary transfers & if you pass it a bad switch
it doesn't respond with a error message. I can't recall all the
mistakes I made, stuff like using /b or -b or whatever, but it did
make a difference. It got so bad for me I almost recompiled it
to do nothing but binary transfers.

: >virtue of it being the best thing around and one of the ONLY things
: >around for a few years so that was a unique situation.
:
: I just have a quibble here. The 2600 wasn't alone in the
: market by any means (Bally's Astrocade, Odyssey 2, and the Channel
: F for example) when it was introduced. It was also not the best
: thing around (although "best" is a subjective term), as witness
: Bally's machine.

The 2600 was clearly better in specs than all other machines except the Bally.

The Bally has better resolution specs, but no hardware sprites. In the long run, the 2600 had enough flexibility to allow programmers to work around things to do things which blow the Bally out of the water.

You never heard anything about the Bally being able to do anything close to display list tricks. But raster interrupts (which are differently done on the 2600 from the 400/800 but look IDENTICAL) are a lot easier on the 2600 because you are building screens by hand and hand timing the whole thing.

If the Bally DID have hardware sprites, it would have been about comparable to the Atari 400/800 2 years earlier. Some method of raster interrupt color register shifting was probably possibleon the Astrocade, but in 1977 they didn't think it was necessary in light of it being a novelty to be color at all. But it doesn't seem to have hardware scrolling or anything.

: -Bry

In the rec.games.video.classic group, people were trying to
locate the code, but had no success. Allegedly, Atari included the 7800
encryption code in the Lynx development package. Perhaps a Lynx developer
could help us out.

Not quite correct. The Amiga was used as the Lynx development
system because both the Amiga and Lynx were developed by the same people.
However, I've heard that Atari gave away the 7800 encryption code on ST
disks because the ST was often used as the development system for the 7800.

7313. VT850 help...sort of

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-10 23:53:14 UTC
From: ba930@FreeNet.Carleton.CA
Message-ID: <D0MD0q.Gnu@freenet.carleton.ca>
Source record: 96393

For anybody owning the VT850 progra, by Curtis Laser...here's how to
capture if you haven't already figured it out.

1. press select+3
2. press f
3. exit this menu
4. to start capture, press select+2
5. to end capture, press select+3

BTW: It works...it might not capture the text the way it should be, but it
works. Also, don't expect to be online after you've done your capture...it
tends to hang the modem when you close capture(it does this every time).

=CB=

BTW#2: I figured it all out myself! NO DOCS!!!!

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

This is a public statement.

In the on-disk documentation file for Derek Mihocka's PC XFormer 3.0,
he states that Ulf Petersen and his company, Avatar (formerly known as User
Mag) are pirates because they "have refused to purchase the product from us."

I am a personal friend of Ulf Petersen. He has visited me here in the
US, and I spent a month this summer visiting him and touring Europe with him.
I know him quite well.

****
* Ulf Petersen is no pirate! Avatar does NOT sell pirated products! *
****

If Mr. Mihocka has a problem directly selling his product to Ulf/Avatar,
then that's his problem. But publicly slandering him for no good reason is
a cowardly thing to do.

Derek, you should be ashamed of yourself.

In truth, it's the exact same game. If you look at the original of Rescue
on Fractalus! it will say 'Behind Jaggi Lines' when you boot it up and the
title screen pops up. There is absolutely no difference between the two.

BTW: Does ICE-T have a capture feature? I've never seen it working(my copy
has a bad CRC)?

The pirates of the Lucasfilm games before they even came out was the main reason that Lucasfilm gave up the Atari platform, as you know, these games wound up being released by Epyx, NOT Lucasfilm directly.

Epyx, as you know, was absorbed by Atari, which is why these games eventually became the property of Atari Corp.

I carry a big grudge against the Atari pirating community. They helped kill the platform.

Actually, Atari were supposed to be releasing the games for Lucasfilm,
but then they pulled out of the deal (can't remember why. There was a
mention in it in the Compute! review of Fractalus and Eidolon, if you
want to check). Epyx bought the rights when LFL didn't do anything
with the games.

> Epyx, as you know, was absorbed by Atari, which is why these games
> eventually became the property of Atari Corp.

You got that the wrong way round, AFAIK. Epyx was a company started
by one of Atari's programmers; they didn't get bought up, they went
bust. Atari got the rights to the games because they paid for them,
same as they did with all the other stuff that was re-released on
cartridge when the XEGS came out.

> I carry a big grudge against the Atari pirating community. They helped

The C64 had just as big a pirating community, if not bigger. All of
the people I knew who had C64s bought them so they could copy games
from everyone else who had one.

>from everyone else who had one.

From imperical and anecdotal evidence it is apparent that all
platforms have experienced piracy at one time or another.
Heck, even the SNES platform has experienced it. I was offered
a fairly inexpensive unit that would copy cartridge games to a 3.5" disk
abou a year ago. Just rent the game, copy it, and your collection will
grow to a huge size in no time at all!
As a BBS SysOp, I am often asked for copies of games/programs
that I mention using in the various message subs. I always refuse,
but it just goes to show me how rampant piracy is in the MS-DOS world.
As I mentioned before, I was in the Apple][pirate scene,
so I know also that that platform had MUCH more than its share of
pirates.
You mention Commodore, and others have mentioned Atari.
I don't think we'll ever be free of piracy, because as soon
as one generation learns not to do it,another generation reaches
the age at which they begin to pirate.
Essentially, the problem is how easy it is to copy programs.
This I believe will never be surmounted. They've tried for at least
fourteen years now to devise means that would stop people from copying
their property. It just isn't going to happen, since whatever technology
is used to stop copying can undoubtedly be used to enable it.
So, education won't work and neither will technology.
I am sorry to say that piracy (and the higher prices it causes)
is here to stay. We'd better all learn to live with it, and that includes
the publishers and maufacturers.
On second thought, I suppose they have learned to live with it.
Although the MS-DOS world is riddled with piracy and always has been,
there are no signs that companies are fleeing from supporting the
platform.
I guess there is a critical mass of pirates that is reached at
which point there are not enough people buying legitimate copies of the
programs to justify new titles. Hopefully we will never see this
happen on a platform again.

Just some thoughts...

-Joe

"Pick the machine up a couple of inches and let it drop" was the
official Atari fix for this problem (they were too cheap to use
retainer clips on the socketed chips). You have to remember that the
1049ST had no user serviceable parts inside the case. Opening the
case and getting to all the chips was not trivial (and voided your
warantee).

May have had to do with Atari Inc. being sold and split up into
Atari Games and Atari Corp. Lots of deals fell through the cracks.

Atari programmers started Epyx? I don't think so. Automated Simulations
was started by Jon Freeman and Jim Connelley in 1978. Name changed to
Epyx. Their first games were for the Commodore PET.

Glenn has been checking into the ownership of certain program.
It turns out that Atari got all rights to software made for their
various systems. That may include the Lucasfilm titles, but I
really suspect LFL kept tighter control.

Someone created a Ballblazer clone for the PC recently. It's
been pulled for some legal reason. Who went after him, LFL or
Atari?

Multitasking is not a fetish. I think it's a case of those who can't
don't know what they are missing.

I mean, get real. I'm not going to just sit by if people are saying
ludicrous stuff lke 'hey, who cares about color, who cares about sound,
who cares about clock speed, who cares about resolution'? Add it all up
and that's everything that makes a computer system!

Do you remember that little article, I think in the old AC, that said
'Atari provincialism???'

The point of that was that burying your head in the sand and saying that
everything the Atari does is perfect and everything else in the computer
world is stupid or frivolous or useless, that that is really dangerous
for the Atari's future.

If nobody was aware of how MS-DOS worked, we'd never have SpartaDOS, for
instance.

Tom Hunt is great when it comes to trying to take other computer ideas
and translate them into Atari utilities. Not ALL of them are impossible
to port. For instance, Tom's filenotes are one feature of the stock
AmigaDOS filesystem. Or his self-extracting archives. Not to mention
slaving new peripherls (MIO/BB/MIO2) or supporting different text
translations--if you want to go to an extreme. Why do anything by
ATASCII? Isn't that good enough? Boy, we'd really be isolated without
ASCII in Bobterm and VT100 in FlickerTerm.

I emplore you not to make the leap from saying 'this is good enough for
me' to 'anyone who wants more is abnormal'.

cl: I will be releasing a new version of SpartaDOS
cl: specifically for use with the Xformer (2.5 included)

clCould you tell us why it doesn't work currently with Xformer?

Spartados does NOT use the os rom serial routines . It uses its own
routines inorder to get high speed SIO. All high speed doses are like this.
The high speed SIO does NOT use interupts. It monintors the pokey sio
interupt flags but it does not enable them to interupt the processor
directly unlike the os rom sio routines. My guess is that Xformer does not
emulate the pokey hardware fully. If it did, things like this would work.
Spartados 3.2z should work...

The same thing happens with SuperDOS.

blBTW: Does anyone own/has anyone used a mulitplexer from CSS? I'd like to blknow how well it works, and if is really worth buying, since my dad is blplanning to try and get some for the Atari XE Group here in Ottawa.

It pluges in to the cartridge port. Inside it has a 6522 VIA chip and a bus driver. the 6522 is mapped into the D5xx hex memory area. It has a pass through connector on top for other carts. All slave machines must have a rom installed. The master runs a master program. The master has the hard drive or whatever on it. All units are connected by a ribbon cable. works well. Had it running on my 800 with spartados 3.2z.

So I simplified history. Atari paying for something to me is the same thing as 'got bought up'. I know full well the history of Epyx, and how it relates to Arcadia/Starpath and the Lynx, but I didn't want to get into a huge history lesson.

: The C64 had just as big a pirating community, if not bigger. All of
: the people I knew who had C64s bought them so they could copy games
: from everyone else who had one.

The C=64 people enjoyed a very UNUSUAL and LUCKY situation in their platform that allowed them to enjoy about 5 more years of game releases than they normally would have gotten by virtue of unhindered market forces. Since several companies signed a contract to produce games over a 5 year period, they were obligated to continue making games no matter what, even if every game they released made no money and was pirated left and right. If they didn't have this protection, the pirating in the C=64 community combined with the obvious downslide in the userbase which was also in evident with every other 8-bit platform, would have resulted in much the same pullout rate as the Atari.

Pirating was just ONE factor in all this, but it WAS a big one.

>point is people seem to be trying to say multitasking is required
>or at least highly desirable for computers in general. I know
>or should say come in contact with 300-400 people that use
>computers on a daily basis & virtually none of them need or use
>multitasking.

I submit that these users have not worked steadily with an Amiga
for a year or more. Like I said, there is a freedom of doing things
that is difficult to explain. It's more than just specific examples.
Thus, maybe the examples I quoted diminished rather than strengthened
my position.

All I can say, is that most of our Amiga club really appreciates the
OS. And these are not technically oriented people. Even in these
times of uncertainty in the future of the Amiga, most of us are
clinging to our machines. The price of used Amigas is skyrocketting.
The users who haved jumped ship to join the dark side of the force,
(Windows), complain about their environment.

Multitasking, when done right, really is a more pleasurable way of
interacting with computers. To say someone doesn't need it, just
because they have not gotten used to using it yet, does not seem
valid to me. History is filled with inventions that people got
along just fine without, but now that they are generally accepted,
most people don't want to go back to the old way. Even if they
were plenty happy with that way before the invention came along.

>multitasks.

Easy answer to this one. Windows is extremely poor in both design and multitasking. In another message, where I cite Ex-Amiga users that migrated to the Windows world, they don't multitask anymore either because Windows doesn't do it very well. And many/most IBM programs are not written with the thoughts of multitasking built-in from the ground up. That's why these people are upset. They may have gotten a more popular computer, but they don't enjoy their computing as much.

Sorry. I used the example of EMPLANT as the basis for my post.

Its problem was, the entire task needed to run in supervisor, because
the Mac requires it. There wasn't a provision for leaving the task in
supervisor mode all the time.

Okimate 10 color printer, but I thought I'd share some ideas with
those who are interested.
I recently purchased the Okimate 10 with Plug 'N Print for use
on my Atari system. I originally had one when they first came
out, but sold it when I got disgusted with Atari Corp. back then.
At the time, I was using standard pin-feed paper with it, and
getting terribly poor results. The printing was almost unreadable.
Now, many many years later, I have much more experience with
lots of different printers, including ink jets, laser jets, and the
new crop of thermal transfer printers (ie, Tektronix Phaser 200i, which
we have at work). Seeing that Phaser 200i do such beautiful printing
with essentialy the same technology that the Okimate had ten years ago,
I decided to take another look.
I called around and found that B&C had the Plug 'N Print, but
not the printer itself. However, Bruce said he had seen one at one
of the surplus shops around town (the Silicon VAlley is riddled with
those places...ah, how I miss living in CA!), and he would be willing
to go buy it and resell it to me. The price was acceptable, so we
agreed.
I just got the machine Friday. Bruce had done a test print on
it, but the printing came out aweful. He wrote a note suggesting I
get a new printhead. (BTW: Okidata still supports these machines. You
can still buy ribbons, manuals, printheads, etc. from them. Ribbons
are also available through many office supply dealers.)
I had purchased some ultra-smooth paper in anticipation of
having this machine. It is Wayerhauser First Choice Premium Laser
Paper, and runs about $7.99 per ream at office supply stores. This
stuff really is incredbily smooth, and a bit thicker than normal bond.
At any rate, I ran this paper through the printer, and the
result was flawless! The old Okimate advertising claim of Letter
Quality output just became true!
My advice to anyone who wants color output for their 8-bit
is to pick up one of these machines if you ever see them at a
garage sale, flea market, etc. (But make sure to get the Atari
version of their Plug N Print!)
The Okimate 10 provides 26-color output beautifully for most
Atari-compatible paint programs (Koala, Atari Paint, etc.).

Buy one if you can!

-Joe

What's the problem with discussing multi-tasking, Robert?

Why not try to come up with a new OS that allows the faithful old 8bit
to multitask. I wish them all the luck in the world in this
endeavor!

Please tell me what you had to do to modify an 800 to work using the MUX OS? I have an 800 that I'd like to add as a slave to my MUX network.

In addition, how did you get the 800 to run SpartaDos "d" when using it with the MUX? It should have been using the modified "z" version.

Any information greatly appreciated.

I am using Atari's Paint program (really excellent...well worth
the purchase price just for the excellent manual which has a history
of art, "how computers work", a profile of "current" computer artists,
etc. in addition to the "how to" you expect to find) right now, but
you can also use:
Koala Painter/Koala Pad
Super Sketch from Personal Peripherals
Fun with Art from Epyx
Tech-Sketch from Tech Sketch, Inc.
Powerpad from Chalkboard, Inc.
Micro Painter from Datasoft
Movie Maker from Reston Software
Micro Illustrator
or User created graphics dumped to file.

This is with the "updated" Color program. The original (whih
was only shipped the first six months or so of the unit's production)
only supported Koala, Super Sketch and user graphics, I believe.

Also, of course,you can directly control it from BASIC or
any other language you like, should you wish to...and thus be able
to mix about 50 different colors.

-Joe

7348. Why do you use an Atari 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-12 01:03:03 UTC
From: Joe Walsh <ransom22@delphi.com>

Well, we've talked (to death) the useability of Atari computers,
and we've discussed areas for improvement of our favorite machines.

But, any number of computers available in the stores and in
garage sales and flea markets (ie, new and old computers) could do
all of the things we need to do. Some could do some things better.

Why, then, do we continue to use Atari 8-bit computers?

I would like to hear the reasons so many people continue to use
these machines. In my case, it is because of the happiness it brings me
to use it. It is rather weird, I suppose, and downright impossible to
explain to someone who doesn't feel the same way, but that is the reason
I have come up with for my continued use of these grand old classics.

So, what is your reason?

-Joe

: : Thanks for repeating what I said...only in detail. =)
: : I never said it wasn't more powerful. Yeah..the 7800 has a NEW ENGINE...
: : but the architecture of the beast is the same.

: Sorry. It's just that your post made it sound like you thought
: the 2600 and 7800 were basically the same machine. The uninformed people
: of the world wouldn't realize that the 7800 is as good as an NES.

: : A Pinto is a Pinto even with a turbo engine installed....
: : however, I would much rather have that engine.

: Actually ... the 7800 doesn't even use the same microprocessor as
: the 2600, so that argument isn't really valid, either.

Um...4 is it now? Yeah.. 4 times I have been slammed. =(
I guess I just missread all the documents which said "ignoring the
7800 in 2600 mode, which is in fact the exact same as a 2600..."
I keep looking at the 7800 from and engineering point of view.
You see, it wasn't "Okay.. what a great machine we have.. oh wait..
let's make it 7800 compatible..."

It was: "How can we make the 2600 into something better..."

At least that is how I perceive it.

Yes, the 7800 is BETTER than a NES.... much much better....
but to say it isn't a 2600 is also wrong.

I think I'll go hide now....

Well..for all the good times I have had with it.. all the programming..
all the games... all the laughs... (You are speaking with someone who
played 2600 Fathom just to get the stupid poster)...

And the hardware is SEXY. From an engineers point of view... the
8bit is beautiful...

Also... I will never in my life time be able to "obtain" every piece
of published software for it. I am always finding new programs for it..
and there are more coming out for it all the time....

That, and its a BIG relief to know I can go home and find my faithful
8bit working perfectly for 10 years or more. No memory protection errors,
no core dumps... no seg faults... pure bliss and that nice beep beep..
from the drive...

>games wound up being released by Epyx, NOT Lucasfilm directly.

Pirates may have been a contributing factor, but I doubt it was the primary reason that Lucas Games dumped Atari. Behind Jaggi Lines and Ball Blazer were pirated by Atari employees, by the way. Lucas did go on to release at least 2 games for the 800, and they were working on several games for the 7800 when the shit hit the fan in July of 84.

I think Lucas gave up on Atari because before the Warner sold the company, it was run by a bunch of hopeless bozos who didn't understand the technology of the industry or the market they were trying to serve. After Warner sold out, Atari was run by Jack and Sons. I can't see the Lucas folks putting up with that crap.

>I carry a big grudge against the Atari pirating community. They helped
>kill the platform.

The pirates didn't help matters, but Warner management and the goons they hired to run Atari are what killed Atari.

Drew

7361. Re: Why do you use an Atari 8-bit?

A combination of games, fun tinkering, and simple irrational emotional attachment.

Not to mention how cheap it is to maintain this hobby.

I may continue to use it in a more useful context as a BBS if I go back online. It's one application for which I think the machine is well suited although there is still significant room for improvement with PRO! and Forem (the others are too far behind to even mention including Carina).

>>And the hardware is SEXY. From an engineers point of view... the 8bit is beautiful...

Wow - I never thought of that but I guess it's true! I've got an old Mac with a hard drive, modems and a scanner that fits neatly on a small desk. It's my primary machine but it's not - well - sexy. My 1200XL, on the other hand is surrounded by 810's, a Rana 1000, 1010, 820, 1025, 825, - and a rotary phone with the old "standard" handset to use with my 830 acoustic modem. I had to buy a computer desk and then add more shelves just to handle all the hardware. But it *looks* nice - kinda big and puffy and warm and friendly.

In addition, I can add equipment to my Atari for next to nothing compared to my Mac. For example, a few months ago I picked up a new 820 from Best just to use as a label printer - it cost me about $40. A "cheap" label printer for my Mac is at least $150. And the 820 has got to be one of the greatest looking printers of all time. And the noise it makes is actually kind of nice-sounding once you get use to it.

I'll never give it up.

- Mark

From: jharris@cup.portal.com
Message-ID: <129313@cup.portal.com>
Source record: 96193

Here's a good quote I just read, that comes from Dave Haynie, who was the Senior Systems Design engineer for the Amiga.

"The reason everyone likes Multimedia is because human beings are used to a real-time multitasking world. The Amiga got all of those elements right 10 years ago."

I think the point I was trying to make earlier, is that humans are naturally multitasking. But most people don't conceive of most of today's computers as multitasking tools, because they aren't done well. If they could just get used to a good tool, it would seem more natural to them.

That is interesting... I immediately identified 'stlg' as being
"Pounds Sterling". If I had seen a '#', I would have first thought,
"number of", and only afterwards have thought, "pound sign".

7368. Can the Atari use C= Disk drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-12 10:58:28 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.119.000AF9D7@genesis.informatik.rwth-aachen.de>
Source record: 96197

Hallo !

Last week I got a book about the C= disk drive 1571.
I.m.o. it must be possible to connect it to an Atari-8-bit -computer (of course by reprogramming the ROM).
Because the drive work with an 6502 (1050-->6507) and supports also the 40 tracks, 26 sectores format.
Is here anybody who had done something like that ?

Matt

7369. RAM upgrades???

From: HEGEDUS@mszi.pmmf.hu
Message-ID: <34D80142D19@mszi.pmmf.hu>
Source record: 96199

Hi,
My BIG problem is the memory upgrading... I don't want to buy a
RAM expansion, I wanna do it myself, but I don't want to make a
"onlyIcanuseit" one, so I need some info about that...
So, please help meeeeee!
I don't want to make a 128 Gbytes RAM expansion, I think the 256k
(or the 64k) must be enough for me, but I don't know where should I
connect it. I know how can I use the standard 130XE expansion, but I
don't know how can I build it in my 800 XL.

Bye,

Tomika

This is your lucky day!! :-)

I just so happen to be working on a college assignment about the
World-Wide Web and have some info to hand. Here are a couple of
places you can try ...

World-Wide Web newsgroup: comp.infosystems.www

World-Wide Web mailing list for developers and technical discussions:
send e-mail to listserv@info.cern.ch with "add www-talk" as the body.

How to write HTML:
http://www.ncsa.uiuc.edu/General/Internet/WWW/HTMLPrimer.html

You can also just try logging into the main Web at CERN and get your
info from there ... believe me when I say that there's masses of info
on HTML and the Web available through CERN!!

Hope this helps.

7373. using an XE with a Canon Bubble Jet

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-12 12:16:11 UTC
From: cooley@nevada.edu
Message-ID: <3cheub$t4n@news.nevada.edu>
Source record: 96203

hello. Is there anyone out there who has successfully used an Atari 8-bit with a Canon Bubble Jet? If so, this message is for you. I have also used this setup. Unfortunately, when it comes to using it with Print Shop, things don't work very well. I guess since this printer is different than a regular dot matrix printer like i've used Print Shop on before, it doesn't want to type at the very top of the page. It always spaces down about 6 or 7 lines. Anyone know how to fix this? I've tried everything!! The dip switches call for switch #2 to be set to 'ON' if the software application calls for 66 lines. I have set it to 'ON'. Switch 4 should be set to 'ON' if the paper is 12 inches. My paper is standard 9 1/2 x 11, so i set it to 'OFF'. Switch 5 should be set to 'ON' if you are using the Epson Graphics mode. Of course switch 12 is set to 'ON' to emulate an Epson. After doing all this, I still end up with the text/graphics I'm printing with the Print Shop, cut off at the bottom of the page.

Is there anyone who could help me? If so, please reply...

thank you!!

Source record: 96305

I have just got some more stocks of the following commercial software
items:-

DROPZONE (disk)
SOLAR STAR (disk)
CYBORG WARRIOR (disk)
SUMMER GAMES (disk)
DESERT FALCON (rom)
GATO (rom)

The disks are priced at #5.25 ($10) each and the roms at #6.50 ($14)
each.
US$ prices include shipping to USA
UK# prices include UK p&p, overseas add #2 per order

Stocks are limited so E-mail me at chmrig@leeds.ac.uk to reserve
any items you might want. Also E-mail me if you require more
information about any of the titles.

Postal address: RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH,
DONCASTER, DN5 8BW, ENGLAND

Don't forget I also sell JAWBREAKER, MOUSEKATTACK, ARENA, BUBBLE ZONE,
SUPER PRINT-LAB XE, GTRACKER and limited stocks of Halley Patrol!

RICHARD GORE

From: jeking@xmission.com
Message-ID: <3chphp$hr5@xmission.xmission.com>
Source record: 96308

Help! In order to use my upgraded 130xe with my MIO, I need to purchase
or trade for an XE MIO adapter. Tried to order one from Best and B&C,
but they were apparently out of stock, as my order came back minus the
adapter, but with a cash credit.

Anybody having an extra that they'd like to get rid of (trade preferred),
please contact me.

Need an ICD brand adapter, as the K-products (formerley Supra) doesnt
seem to work properly.

7382. R2: on P:R: Connection

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-12 17:45:20 UTC
From: jjmcwill@next5
Message-ID: <3ci27g$hgq@news.mtu.edu>
Source record: 96311

Has ANYONE successfully used the R2: port on the P:R: Connection?
I tried it using various handlers, including the SpartaDOS-X builtin
RS232 handler, and the P:R: Disk RS232.COM and PRC.SYS handlers.
I tried both SpartaDOS 3.2d, 3.2g, and SD-X.

I've tried a BASIC XL program that opens the port, configs it, and
then Print #1, and BPUTs data to it. I printed to it directly from
Textpro, and also used the SpartaDOS 3.2 SPRINT command to make P1:
redirect to R1: and P2: redirect to R2:

In all cases, output to R2: went out R1: instead, and R2: remained
"dead". I had my PC clone monitor the ports via a null modem
cable and a telecomm program. The actual R1: port worked great,
and all methods I used resulted in successful data appearing on the
terminal screen of the PC. I'm just disappointed that no matter
what number I put after the "R", the data appeared on the R1:
hardware port.

I'm using Revision 4 of the P:R: connection.

Why am I doing this? I'm gonna probably get a cheapo laser printer
in january or February. Right now, I'm looking at the Brother Hl630 and
the Okidata Ol400e. Both run about $400.00 depending on where you look.
The OL400e has two ports, one parallel and one serial. I was gonna
connect the PC clone to the printer parallel port. On the Atari side,
R1: was gonna null modem to the PC for file transfers back and forth,
while R2: was used to print to the laser printer via the laser serial
port.
Picking up an extra R: cable would have beat printing out the P:R:'s
P: port, and purchasing a parallel to serial adaptor, or a dual parallel
automatic switching device.

Jeff

>
>-Joe

Basic reason: alot of programs do not exist on modern systems and those that
do are of poor quality.
Complex reason: The style. Computing in the early 80's was more of a learning
& doing experience. The cases were atractive, and manuals were written from
the hobbiess point of view. Todays systems have thestyle and grace of a toster.
Werid reasons: The joy of seeing someone's stunned expression when they
realize that computers besides the PC & mac existed and that a POPULAR
one was made by atari. I love also seeing people pick up the computer and
saying "ok, I found the keyboard now where is the computer." ;)

I don't think you can get around this problem. I'm using an Epson RX-80F/T
and I have the same problem. Maybe if you put the paper in after the
printer is done line feeding? That'S if you can tell...the damn things are
so quiet. I just set the paper to the highest point on the page before it
will really screw things up and shred the paper instead.

6 or 7 lines?! As in about an inch? Bubblejets have a hard top
margin (because of the paper feeding mechanism), but it's only about a
line or so.
Do you have a DIP switch for margins? I don't have my Bubblejet
manual handy, but I think mine has a switch to give it a big top or
bottom margin.

>everything!! The dip switches call for switch #2 to be set to 'ON' if
>the software application calls for 66 lines. I have set it to 'ON'.

That may compress the graphics, so you might want to try it with that
switch off if things come out 14/15's the size they should.

In December, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our catalog disk and our disk-of-the-month.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, December 14, 1994
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

I have an 800 XL (wish I had an original 800, though). I do not use Atari 8-bits for my main work nowadays, but I think there is a tremendous usefulness in old machines, like the 8-bit Ataris. For one thing, they are great way to distribute intelligence. As an AI consultant, I can tell you that knowledge representation has become very compact in some forms, such as neural networks. All they really involve are taking user input and running it through a series of mathematical equations and getting an answer (finding the right equations is the hard part- that I do on a PC). I believe that neural networks developed on faster hardware may be implemented on 8-bit micros for use in the field. For instance, in security work, home/factory automation, etc. In fact, it is my assertion that, for many applications, users may receive adequate response even when such systems are coded in interpreted BASIC. (Actually, I have been considering turning this into an article.) Anyway, think about it: here you have for cheap (!) platform which is fully integrated: keyboard, OS and BASIC in ROM, graphics hardware ready to perform any number of complex dedicated tasks. If the old hardware wears out, you can simply replace it with another cheap box. Further, some of the Atari models (like the 800) have the added benefit of so many joystick sockets. Every one of those ports offers a simple (!) way to interface the computer with the environment. Anyway, this is just something I have been toying with and haven't put into practice, but I have no doubt that all of this is entirely possible.

: Um...4 is it now? Yeah.. 4 times I have been slammed. =(

Whoa Andrew! Nothing personal was intended by my posts. I think
you make some of the most intelligent statements I've seen (especially in
comparison to people like Sinclap) recently. I just don't agree with
everything you say. No slam intended.

: It was: "How can we make the 2600 into something better..."

: At least that is how I perceive it.

I perceive it as "Let's make a super system that will blow
everyone else out of the water, but won't piss off our customers because
it will let them play their old 2600 games."

The 5200 received a LOT of flack for not being 2600 compatable,
so the 7800 was made compatable with the purpose of rectifying that
mistake. The 7800 is not a 2600. It has a "2600 mode", but the mechanics
of it are "7800." It does not use the 2600's processor. It has a faster
graphics engine. It has more powerful sprite characteristics. It has
larger games. It has a two button joystick. It has a pause. It uses
larger cartridges ... etc, etc, etc.

7402. Disabling 800XL Cartridge?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-13 02:46:04 UTC
From: sad@id.net
Message-ID: <3cj1tc$fa6@condor.ic.net>
Source record: 96331

I'm trying to get Jumpman to run on an 800-XL. Unfortunately it keeps coming up and telling me that I need to remove the cartridge. I know the 800's differed in that you had a left and
right slot for cartridges, right usually being for the Atari Basic cartridge.

So is there anyway to get Jumpman to work? I used to play it on my 800 and I played it on my
130XE a number of years back, but I have no idea how to get it working.

Thanks,

Scott.

>I may continue to use it in a more useful context as a BBS if I go back
>online. It's one application for which I think the machine is well
>suited although there is still significant room for improvement with PRO!
>and Forem (the others are too far behind to even mention including Carina).

Now there is something I have never considered the Atari 8-bit
well suited for. It is pure ignorance on my part, I must say, as I
have never downloaded any of the BBS programs for it.
However, I do run a MS-DOs based BBS, and find it hard to
imagine offering what I do on that machine on an 8-bit. But I am open
to argument. :)
My board is NOT a "filez" board...I offer popular files for
download as a courtesy only. However, I do offer a multitude of local
and networked message subs. Would the Atari be able to handle 32 or
so message subs? Which networks are available for use in an Atari
environment?
the other big attraction of my BBS is its high-quality registered
online games. Are there such programs for Atari BBS's? What types are
they (ie, tradewars-style, etc.)

Also, how well do the Atari 8-bit BBS software packages adapt
to the capabilities of callers calling in on differing machines? (ie,
does it offer ANSI color grapics?)

I am very interested to hear your reply.

Thanks,

Joe

Lesseee...it is DX5048. Copyright is 1983, Atari, Inc.
Originally by Capital Children's Museum. I read about it in a book on
Atari software that I got recently. BEST has them for $25 each.

>All of these have a PRINT to Okimate option that dumps images out in
>a colorized format? If not, how do you get them to print? I dont recall
>seeing a PRINT function in the Koala program.

Sadly, no, there is no Print function in many (any?) of these.
However, the Okimate Plug 'N' Print comes with a program called "COLOR"
that reads any of those files (including, of course, if another package
uses one of those file formats) and dumps it to printer. A bit more
laborious than printing from the original program, but it works. :)

Andrew K. Heller <heller@akh104.rh.psu.edu> writes:

> How much for the kit? I can pick up a used OK10 for $12 at a local
>thrift shop.. but I would need the Atari kit and some new ribbons and
>manuals...

Dunno how available they are in the Atari resale community.
the only one I could find was at B&C, and it was the last they had,
I believe. $29 is what it cost, for the record.

> Got a number and price list for OK?

Okidata may be reached at 1-800-OKIDATA. Their primary reseller is
a company called Agson, Inc. (operating in New Jersey, as does Okidata).
This company may have the Plug N Prints, or at least the parts that make
up Plug N Print. Their number is 1-800-444-4060.
Plug N Print is comprised of the following REQUIRED items:
1 Atari SIO card that fits into the printer
1 Okimate 10 Demo/Color disk which contains the program to
print from (named "COLOR").
1 Black Ribbon
1 Color Ribbon

Optional stuff in Plug N Print (ie, stuff you may already have, or can
easily get)
1 SIO cable
25 Sheets of Pin-fed paper

And, one item that isn't required but which is nice to have,
the Okimate 10 manual.

I know for a fact you can get the manual and ribbons from Agson.
The black ribbon is item # 52102701 (price: $5.95), and the color
ribbon is item #52101602 (price: $6.95). Both of these are also
available at B&C.
The manual is about $15, if I remember correctly, from Agson.
I do not have the item # for that.
If you can get the disk and Atari interface card from them or
Okidata, in addition to the ribbons and manual, you will be in business.

Good luck!

Atari boards are good for Atarians to run because they offer a connectedness they wouldn't have otherwise unless they had an internet account (like us) or had another 8-bit board in their area (which is not always the case these days).

The primary reason running a board on an Atari is good is that it is so cheap. The biggest expense would be the hard drive interface. But if you wind up burning CPU after CPU, it only takes about $50 at the most to replace them.

I must plead ignorance that I do not know of other minimal setups and how much you can get out of them, like shitbox 286s or Amiga 500s as BBS machines... They may be a lot better insofar as offering more filebases or FIDO inerconnectability. However, the only reason that there ISN't a way to crossnet Fido or other stuff into the Atari is a lack of software sophistication, not an archetectural limitation.

Both PRO! and Forem are offshoots of packages that first started with the expected setup being 8 US Doubler floppies and a 1200 baud modem.

They have limited filebases because they did not forsee the almost limitless size of Fido and newsgroup message structures.

If a BBS were written from the ground up you probably wouldn't tell the difference between it and a clone BBS aside from perhaps some module load lag here and there and the fact that it would have a hard 19.2 port speed limit.

One other thing I haven't seen yet is a fullscreen ANSI editor... That's someting most ANSI boards support.

The BBSs do provide fairly good ANSI color. The problem with that is that they don't (as far as I know) allow you to build screens with IBM character graphics in them. Or if they do, they just allow stuff which is analogous to the Atari like he border characters. But that isn't a biggie.

Hi Johnathan,

I answered you in email, but decided to repost in the newsgroup, just in
case someone ran across the same type of machine.

Anyway, you are now the proud owner of an Atari XEGS (XE Game System),
this computer is a repackaged 800 XL. It has 64K and can support a small
ramdisk via software. You can use any Atari peripherals such as
1050/Indus/Percom...etc disk drives, printers, XEP-80....whatever is
available. Atari created a very nice looking XEGS, but did not (typical
Atari marketing strategy), advertise/market the unit enough to really
affect their bottom line.

As for your Gorf cart, you might try opening the cart and VERY GENTLY use
some 600 grade wet/dry sandpaper to clean the contacts. I note that you
said other carts work, thus the problem is with that specific cart.

If the sandpaper doesn't work, the cart may be fragged.

Enjoy your "new" computer!!

Regards,

Vince

Source record: 96343

I like the fact that the Atari world is very stable. Hardware and software exists and works and years down the line that will still be true. I played games on and programmed my 800 from 1982 to maybe 1991 or so before I finally looked at all the grime on case, all the dusty game boxes, and all the disks of typed-in software and realized that the machine was _old_. It just never occurred to me before, all through the rise of the C-64, PC, Macintosh, and non-Atari game systems. There's something comforting about a machine being usable and reliable amid such change.

Then there's the oddball philosophical reason: more and more I'm thinking that the Atari 8-bit machines, in their original non-upgraded state, are more than powerful enough for most modern computing tasks. I don't mean that an 800 could deal with a Mac-style desktop publisher, but more that what is generally accepted as a desktop publisher is a too complex and overly general solution for a much simpler problem. Yikes.

As a person not 'in the field' of computer science my 8-bit has given me the extrordinary feeling of having some mastery over my machine. The 8-bits are not so complicated that, with some reading up on some of the fine literature available (De Re Atari, Inside Atari Basic, Inside Atari DOS, etc.) ,anyone can't get a handle on the inner workings of the machine. I love that feeling of understanding what's happening and being able to control and modify it. That, coupled with the never ending fight to push the platform to it's limit by so many, makes the 8-bit a very enjoyable hobby. Plus I trust the damned thing. Over 10 years of faithful service and counting. I don't just use the 8-bit, I learn from it.

I have the following Atari 8-bit items for sale:

* - denotes Game Title
# -denotes Productivity Title
@- denotes Educational Title
^ - Uitility Title
All are disk based, unless noted other wise.

Software without boxes and have docs:

XLent Word Processor (#)
Flight Simulator II (*)
Juggles House (Cassette) (@)
My First Alphabet (@)
Time Wise (#)
Typo Attack (@)
Home Filing Manager (#)
Family Finances (#)
Bridge 4.0 (*)
BookKeeper (#)
BankStreet Writer (#)
Chop Suey (*)
Stock Market (*)
Atari Speed Reading (Cassette) (@)
AtariWriter (Cartridge) (#)

Software without boxes and docs:

PacMan (Cartridge) (*)
PacMan (Cartridge) (*)
Antic Disks (3) All three for $7+S/H
Star Raiders (Cartridge) (*)
CheckMate (#)
Jaw Breaker (*)
World Championship Karate (*)
HomeCard (#)

Software with boxes and docs:

Zork I (*)
Zork II (*)
VisiCalc (#)
Crusade in Europe (*)
Nato Commander (*)
Conflict in Vietnam (*)
Top Gunner Collection (*)

Spy vs. Spy (*)
Decision in the Desert (*)
Peggammon (*)
F-15 Strike Eagle (*)
BallBlazer (*)
Kennedy Approach (*)
Puzzle Panic (*)
Ace of Aces (*)
Reforger (*)
Fight Night (*)
Blue Team Bridge (*)
Archon (*)
Hardball (*)
One on One (*)
Eastern Front (*)
Mickey in the Great Outdoors (Cassette) (#)
Interlisp/65 (^)
Financial CookBook (#)
Combat Leader (*)
Home Filing Manager (#)
AtariWriter (#)

Books:

How to Program the Atari in 6502 Machine Language
Atari Basic
Compute's First Book of Atari Graphics
Compute's First Book of Atari
Mapping the Atari

Hardware:

800xl no PS and Cables
1027 Printer w/PS and Cable
Supra 300 Baud Modem w/PS,Cable and Software

Parts:

Complete Antic Chip Set
Atari 400 Keypad
26 Assorted IC Chips from various Atari Hardware
items such as xmm-801,xmm-301,810,1050,800xl,1027,850,400/800, all for
$15+
S/H

Please Email me at SERG21@aol.com if your interested in anything and
leave a price
with s/h included and i will get back to ASAP.

In The Winter 12.12.94 Wrote Glenn M. following stuff...

GM> Not to mention how cheap it is to maintain this hobby.

cheap.?? I dont know if its cheap. My XE equipment have bean more expansive
then my ST equipment. For example... CB-)

XE-side ST-side

Sio2pc and 386 $300 HD Kit II + 1.44 Drive $70
100Mb SCSI $150 150Mb SCSI $170
Black Box ca $200 Toplink $130

But its worth evry penny on the XE side.

It is more and more popular here in Sweden now to pick up the oldies again.

>"util" is anywhere on the atari.archive in Michigan.

The 'util' program does a good job, but be aware that you have to have
a TRUE double density drive on the Atari side to use this program.
Indus, Percomm, Rana and others made drives capable of true (180)K
double density. An Atari XF551 or a 1050 with the US Doubler also works.
There is another utility called MULE (Not to be confused with the
cult-status game M.U.L.E) that can read one file at a time from a
1050 enhanced density diskette. I tried MULE, but my PC kept locking
up. Others, however, seem to have success.

Unbelieveable as it may sound, but shortly after reading this thread on
the old Okimate 10, I happened to come by one at a local thrift store
for $5.00. Decided to buy it.

Now for the ever-perplexing question:

How do you get a roll of that thermal paper affixed to the printer? There
is no paper roller/holder. How are you hanging your rolled thermal
on this printer?

7428. Help needed with modem

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-13 15:52:16 UTC
From: ontarget@admiral.uucp
Message-ID: <TL50wc1w164w@admiral.uucp>
Source record: 96255

Recently scrounged up a 4800 baud modem in a liquidation joint
for $5 and thought I would give it a try. Although it seems to be in
working condition and partially responds (dials, transmits data,
displays Terminal Ready signals, etc.), I haven't been able to connect
with local BBSes and on-line services via my 520ST, Mega STe and
800XL. Since the modem (MultiTech Systems MultiModem 208) has one
receptacle and some unfamiliar DIP switches, I'm hoping some kind soul
here might help me adjust them and reach the 4800 BPS plateau.
The modem has the standard RS232 input on the back and has two
phone inputs, one of them labeled "Dial Line" (which I assume
corresponds to "Line" on most modems) and the other described as
"Leased Line or Telset." I assume the latter is a LAN input. Most of
the indicator lights on the front panel correspond with most of those
I am used to (Atari, Supra modems). There is a voice/data switch on
the front, but it doesn't seem to toggle; rather it feels more like a
reset button or switch that once pressed in either direction, defaults
back a center position. The following (DIP) switch summary is provided
(* indicates standard factory settings):

8-switch bank -
1 * (UP) DTP dependent on interface / (DOWN) DTR Forced on
2 * (U) Internal clocking / (D) External clocking
3 (U) CTS Time Long (150 ms) / * (D) CTS Time Short (50 ms)
4 * (U) Scrambler Out / (D) Scrambler In
5 * (U) Enable Auto-Answer / (D) Disable Auto-Answer
6 * (U) CD and DSR Normal / (D) CD and DSR Forced (RS232 pins 6 & 8)
7 * (U) No function / (D) No function
8 * (U) Data Mode / (D) Command Mode

4-switch bank
1 * (U) Test mode enabled / (D) Test mode disabled
2 (U) 4-wire / * (D) 2-wire
3 * (U) Synchronous operation / (D) Optional - 4-wire async.
4 * (U) Dial-up operation / (D) Leased line operation

Thanks in advance for your help. Doug Finch

Well, I am back to full access on Usenet, but not quite caught up yet. So much to read <grin>.

Now my current question, which I _know_ I should know the answer to already, but with Christmas madness upon me, my brain is half dead, and the electronics half is only thinking about VCRs and stereo equipment as of now. Does the Atari 800/800XL/1200XL output a standard NTSC Interlaced video, or is it a pseudo NTSC format with no interlace? (Not a heavy video type, but I think the relatively proper difference is whether it outputs two fields of 262.5 lines each for a frame, or two fields of 262 (263?) lines per each frame).

>So is there anyway to get Jumpman to work? I used to play it on my 800 and I played it on my
>130XE a number of years back, but I have no idea how to get it working.

just hold down the OPTION key while loading (usualy holding it
down until the first screen appears is enough, even if that first screen
is just a logo or the word "loading", but it may be necessary to
hold it for longer..experiment if it doesn't work at first). This will
disable the internal BASIC that exists in all XL and XE models (okay,
okay, with the exception of the 1200XL [G]).

BTW, the right cartridge slot in the 800 was not for the BASIC
cart. It was used by a couple of carts (Monkey Wrench, Monkey Wrench II,
perhaps another one or two). No other carts (and no Atari brand carts)
work from that cartridge slot.

Well, I don't use thermal paper with it. It is true you can
use thermal paper if you do not have a ribbon for it,but the ribbons
print more clearly (and, of course, in color!). So, I use single
sheets.

Let me look in the manual and see if it mentions how to load
roll paper. Hmmm...nope, just mentions that you CAN use thermal
paper. does not say how. I would guess it does not offer a roll
paper holder option. Strange...

My suggestion is to pick up some ribbons at B&C or Agson, Inc.
(1-800-444-4060).

I'm not sure, but B&C is your best bet for Printshop drivers,
in my experience. Their phone # is 1-408-986-9960.

BTW, for you Printshop afficianados, I have a question. I
recently purchased Printshop with a couple of drivers. The drivers
load fine using the PS Companion, but when I do so with the Printshop,
all seems to be fine until I tell it to print, then it says something
like "Setup Process Was Not Completed".
My load process follows the instuctions..load Printshop, go to
Setup, insert the disk before hitting Return for Setup. Then the
drive beeps and I get the screen telling me the driver has loaded.
I hit return again and get back to the Main Menu. But when I print,
I get that message I typed above.
Any ideas? This happens with both the XMM801 driver and the
Okimate 10 driver.

Thanks,

Joe

Are you holding down the option key to disable the built in BASIC (as far
as the system is concerned is an 8k cart) when you switch on???

7444. PC XFormer 3.0

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 02:05:25 UTC
From: legrand@tesla.mbi.ucla.edu
Message-ID: <3cljt5$2tc@news.mic.ucla.edu>
Source record: 96270

Hi, I posted some time back that one can see some emulation problems
in PX XFormer 3.0 if one tries to run the included game "ROCKS" in
Best of Analog rev 4...

Besides the obvious lack of sound distortion (a feature, not a bug, for now
please oh please add full sound Darek!!! We are not worthy if you do!!!),
there are numerous timing critical display list interrupts that seem
to not be returning until a little too late. The effect is that the
first scanline of several character-based scrolling graphics data are slid
slightly to the left...

In addition, there seems to be a problem with collision detection as
the satellites which normally scroll across the bottom of the screen
and only explode if they hit you, explode immediately upon entering
the screen.

BTW I tried mailing this to Darek earlier and got no reply. I also tried
emailing the PC XFormer FAQ guy, but the mail bounced so here it is
in public... Finally, I thought one of the reasons you might not
have answered is you figure I'm a WAREZ D00D... Nope, I just work
with Tom Harker at ICD on jaguar games and when he got it from
you, I tried it out...

Here's hoping you complete the thing's emulation... I have lots
of people I'll buy this for (5) at its wonderfully low price
of $29.95 if you do...

Now if only we could get a CD of all clasic 800 games...

Scott Le Grand

7445. Re: R2: on P:R: Connection

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 02:17:51 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Dec13.211655.26785@wariat.UUCP>
Source record: 96271

0,34
(J. McWilliams talks about using
R2: on a p:r: connection.)
I experimented and here's what I
did. I don't gaurantee that
variations on this will print to
R2: and I surely hope I am
remembering what I did.
1. Boot SpartaDOS with p:r:
connection with modem cable to R2:
connected to a null modem to a XT
set up in a term program at 4800
baud, N, 8, 1. The XT was sitting
there waiting for something to
come in.

2. Load and run BobTerm 1.20 and
set baud to 4800, ASCII, duplex
full. Hit 'J' and configure port
to R2: Start typing on both
computers. It works.

3. Hit <RESET> to get out of
BobTerm. I'm not sure if 'Q' will
disable the R: handler built into
BobTerm or not. Anyway, that's
what I did.

4. Load 'Speed Script' (I don't
use TextPro much as it is much
bigger and I like to have a editor
on my MIO boot drive 180k with a
bunch of stuff I use all the
time.) Load a document and save
or print it to 'R2:'. This
worked.

5. I messed with the 1419 byte
R: handler and 'Sprint.com' and
'Port.com'. I didn't have any
success with any of those. I
suspect the BobTerm handler is the
only handler I have that can
configure to R2: All of the rest
of my handlers don't ask what R:

port to use.

7446. Re: PC XFormer 3.0

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 03:21:51 UTC
From: krishna@max.tiac.net
Message-ID: <3clocf$pq9@sundog.tiac.net>
Source record: 96279

How many of you really thought that PCXformer 3.0 would be perfect?

It's almost as if the uniqueness of the Atari is struggline against emulation on a boring brute-force box.

The Atari8-bit has never been perfectly emulated. Th C=64, Apple II, and ZX Spectrum have all had 100% emulations made of them on certain bigger platforms. They have been, as the borgs would say, assimilated.

I'm a bit ambivalent on all this, but I think in a way it's good that it's proving so difficult to emulate the Atari.

Okay, so I'm out of luck with the thermal paper rolls. Guess I'll have
to fashion my own paper dispenser.

What type of bond laser printer are you using with the ribbons? I contacted
an office supply store and their shipping me their best Weyerhauser
bond for about $15.00/ream.. I hope this is quality enough! [grin]

Darn, I have a 1050 drive which is (as far as I know) stock.

7450. Star Raiders on the PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 04:50:43 UTC
From: davesp@xnet.com
Message-ID: <3cltj3$rjs@flood.xnet.com>
Source record: 96284

Some ten to twelve years ago, my roommate and I, in a dorm-room at NIU (in Illinois), managed to rig an Atari 800 to our stereo while playing Star Raider. Disregarding the complaints from three floors below (through concrete) and the fact that our floor-mates believed that Hell had ascended to Earth, I considered this game to be one of the coolest ever created.

Now, I would like to re-create this universe on my PC. If this is possible, how can it be accomplished?

Please feel free to either Reply or Follow-up to this post. I'd really like to experience this game again.

7451. BLACK BOX

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 05:33:00 UTC
From: per.erik.peterson@asb2.ct.se
Message-ID: <ftn_2.203.221.10$fidonet.org_2eee839d_Per.Erik.Peterson@ct.se>
Source record: 96277

From: per-erik_peterson@asb2.ct.se

One little Christmas SAGA from Gothenburg. CB-)

Yesterday I tried to install Black Box to my 130XE and it wasnt easy. Wy.??
If you follow the instructions nothing cant go wrong??
Well it did.

First we have 220 Volt in Scandinavia and one 110 Volt adapter followed the BB
from CCS. So I read the pininfo on the adapter and take my 386 apart and
started to connect evru wire as the instructions on the adapter said. What
happend do you think.?? hehehe When I push power on nothing happend exept
that my EGA monitorn lighted white.

I called Fredrik lundholm and asked him. wehat in hell is this???
You have done evrything wrong he told me. +12 --> Ground -5 --> +5 and so on.
he have talked to Bob Puff earlier and Bob have give him the right instruction
to connect the wires right. But now it seams that the RS232 part dont work here
so we shall see if we can find som chip I have burned up.

I also tested to connect an 120Mb Conner to it and the problem is that the
Conner seems to want perity so I will reasive a parity chip soon from CCS and
the story will continue that day.

================================================================

All commercial vendors and developers should be listed here. "Major"
shareware developers should also be listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

7454. Re: Reading Atari 8-bit disks on PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 08:45:53 UTC
From: rstout@legend.akron.oh.us
Message-ID: <rstout.1fvh@legend.akron.oh.us>
Source record: 96283

There is a program called util.com (exe?) that reads and writes text and binary from and to atari and ibm. :) It also will list the files on a double density mydos disk placed in the ibm 360k drive. It also will format a disk placed in the ibm drive to double density mydos compatible. Obviously on the atari side you need a double density drive, like an indus or happy(?) 1050. The file is on the merit software archives at the university of michigan, and by now is probably available on most of the commercial services.

7455. Re: comp.sys.atari.programmer created

: comp.sys.atari.announce overwhelmed with 8-bit topics, just to spite
: those who would say the ST/TT/Falcon is "the" Atari computer...

I heard the Falcon isn't even being made any more, because Atari needed the
production capacity to build Jaguars. Typical *#*&^$% Atari!

Graeme Fenwick gfenwick@mcs.dundee.ac.uk

7456. Rails West

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 11:43:45 UTC
From: quester@eskimo.com
Message-ID: <Pine.SUN.3.91.941214033515.736A-100000@eskimo.com>
Source record: 96286

M.U.L.E was ok; a good enough game for an hour's play; but the main reason I've still got my 800 is Rails West. A complex multiplayer strategy game (written in BASIC!) of railroad construction, corporation management and finance: the predecessor to 'Railway Tycoon'(a graphically sexier but fundamentally less interesting game). Unfortunately the game as it appeared on the market was inadequately playtested and had a tendency to crash. The version I have has been amended (not by me) so as to reduce crashes to a minimum -- but saving after each turn is still advisable.
Is anyone aware of later versions of this game? Did it ever appear on any other computer? Any additional information would be appreciated.

Charles Bell

7457. Re: Why did Commodore beat Atari in the 8-bit market?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-14 12:01:15 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZE00G97.lmcclure@delphi.com>
Source record: 96287

In a message dated 12-9-94, Mark Rathwell said:

"I've never seen a C65, so I can't compare them."

The C65 specs list it as supporting screen modes with up to 256 simultaneous colors, from a palette of 4096, with resolutions extending up to 1280x400 (interlaced). Basically, a lot like an ECS Amiga (i.e., A500 with Super Denise chip), but with more colors in the lo-res mode.

As far as sprites, I believe that was unchanged from the 64 (i.e, no more than 8 sprites per raster).

Unfortunately, I have not had much time to work the the C65 I have to confirm its actual limitations. (As the only C65's in existence are essentially prototypes, not everything is perfect).

Soundwise, the C65 has two SID chips, for six voices in stereo (3 per channel).

??? Really? I see Atari commericals everyday. The DOOM commerical with
the preacher saying we should shoot demons between the eyes is on a
whole heck of alot. In fact I see it more that DKC.

PONG (BENTLEY) systems SEGA MASTER SYSTEM games and systems
TOMY TUTOR game TEXAS INSTRUMENTS 8-bit systems

****************

This is a rather large file (33,680 bytes, 1213 lines), so if you don't like
large files, and/or auctions, PLEASE stop reading now. You have been warned!

I will post updates approximately every 24 to 30 hours, and then delete the
last update after I'm sure the new one is accessible. I will also e-mail
the list to all bidders, and anyone who requests to be placed on the auction
e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

************************************

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

************************************

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, DECEMBER 21ST.

2) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.
-- YES, THIS USED TO BE RULE #9. I'M NOT KIDDING!
```

3) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO
PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #2)

4) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

5) BUYER PAYS ALL SHIPPING COSTS.

6) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

7) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN
PRIORITY (UNLESS THE TRADE OFFER OVERWHELMS ME). I COLLECT FOR OVER
45 DIFFERENT SYSTEMS, PLEASE FEEL FREE TO SEND ME A TRADE LIST.

8) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

9) IN CASE OF TIES, FIRST BID RECEIVED WINS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER,
DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A
CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY
WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH (MY BANK IS VERY
PICKY, BUT THE U.S. POST OFFICE WILL CASH A CANADIAN POSTAL M.O.)

*****

IS IN NEAR-MINT CONDITION.

*****

TOMY TUTOR:

GAMES WITH BOX AND MANUAL:
$10.00* POOYAN

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, ONE ATARI VIDEO TOUCH PAD CONTROLLER, AND TWELVE (12) CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

LOT #16

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER WITH BOX, USER'S MANUAL (200 pgs.), POWER SUPPLY, 1541 DISK DRIVE (PUSH IN MODEL) WITH POWER CORD, SERIAL CABLE, TEN 10 DS DISKS (WHICH MAY OR MAY NOT HAVE GAMES ON THEM -- DEPENDING ON WHO IS ASKING, IF YOU KNOW WHAT I MEAN), KICKMAN CARTRIDGE, MUSIC COMPOSER CARTRIDGE, AND RCA CABLE.

THIS IS A COMPLETE COMMODORE 64 COMPUTER SYSTEM, EXCEPT FOR RF SWITCHBOX.

MINIMUM OPENING BID OF $70.00

*****

LOT #17

NEW RF SWITCHBOX PURCHASE OPTION

SUPER VIDEO ARCADE (SEAR INTELLIVISION SYSTEM), WITH TWO (2) DETACHABLE CONTROLLERS, AND RCA CABLE. SYSTEM ALSO COMES WITH FIVE (5) GAMES [ACCESSORIES FOR GAMES AS FOLLOWS]:

BURGERTIME (WITH 2 OVERLAYS)
FROG BOG -- LOOSE GAME, NO BOX, MANUAL OR OVERLAYS
LAS VEGAS POKER & BLACKJACK (COMPLETE: BOX, MANUAL, AND 2 OVERLAYS)
NFL FOOTBALL (WITH MANUAL, 1 PLAYBOOK, AND 2 OVERLAYS)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)

POWER SUPPLY IS BUILT IN.

THIS IS A COMPLETE INTELLIVISION SYSTEM, EXCEPT FOR RF SWITCHBOX.

MINIMUM OPENING BID OF $40.00

*****

LOT #18 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION II SYSTEM WITH TWO (2) DETACHABLE CONTROLLERS, RCA CABLE, AND ORIGINAL POWER SUPPLY. SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

LAS VEGAS POKER & BLACKJACK
NIGHT STALKER
SNAFU
SPACE ARMADA
SPACE HAWK
STAR STRIKE
TRIPLE ACTION

THIS IS A COMPLETE INTELLIVISION SYSTEM, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $52.00

Hmm, See I looked at Bobterm 1.2x and under the J option, didn't
notice the ability to change the system to R2:....
I'll try using its built in handler though, and then exiting and
loading something and find out what happens. Thanks for the tip!

Was this ever released for the 2600, 7800, or 8-bit? I'm especially interested in versions for the 7800 or 8-bits.

I don't wanna have to buy the NES version! I'd REALLY LOVE to get this for one of my beloved Ataris....

Thanks!
Scott

WC is a different game. Sure, the two overlap a lot, which is why I brought up the comparison, but just because WC doesn't have certain features of SR doesn't mean it is a worse game. I USED to think that, but after I finally PLAYED it, I appreciated the things which WC has and SR does not, which is a lot. You can not dismiss things like the wingman, the capital ships, the sense of PURPOSE that comes with the narrative, the game within the game of the simulator, etc...

I think WC and SR are both great games, but you'd expect a game that consumes 2.5 megabytes on my Amiga to compare favorably to an 8K 400/800 ROM ;)

I do concede that after a zillion plays and without a mission editor of some kind, that WC might become stale...

That is the problem with new games, they aren't random enough.

>some screen shots from a review of it). Was this a pre-release name? Is
>there any difference between this and Rescue? Does anyone out there know
>what the hell I'm talking about?

Yep!

Behind Jaggi Lines WAS a pirated copy of Rescue on F. (as well as
Ballblaster and Ballblazer were identical). The only difference was that
the original versions included some stuff more, such as Title
Screens, Credits, and so on (can hardly remember...). There was a little
bit different soundtrack on the original Ballblazer, but the game was
still identical. I guess somebody hacked into ILM's computers and pirated
an ALMOST-READY-TO-RELEASE version.

OK, remember the good old days!

Bye, MC.

Okay, okay, I know I'm a schmuck and don't know what the hell I'm doing, but how the heck can you get Atari 8bit files off the Atari disks and onto an IBM? I've read many articles and found the "util" and "atario" files on the Atari archive, but I don't quite know how to use them. Do you need an old Atari disk drive or can you read the Atari disks with an IBM disk drive? Unfortunately, my old Indus GT disk drive that I used to use is broken, so if there were a way to transfer the files with an IBM drive, that would be great. Anyway, I would appreciate any advice that anyone has on this topic.

Here's some of the best classics for the Atari 8 bit. Don't miss your chance to really please that Atarian in your family with your astute tastes in 8 bit software. All have docs, package unless otherwise noted. (Shipping not included for single item purchases - will probably be $2.90)

Application Software
++++++++++++++++++++
Synfile+ (excellent database) Synapse $12
Bank Street Music Writer Folio,unopened $10

Educational Software
++++++++++++++++++++
Elementary Biology APX $4
The Pond Sunburst Educ. $10
Note, the Pond is one of the best educational products for developing logical thinking that I have seen. The other really great educational program is Peanut Butter Panic that teaches cooperation. (Unfortunately I don't have an extra of that one to sell.)
Atari Logo Manuals-Ref & Intro Atari $5

Entertainment Software
++++++++++++++++++++++
Archon ECA,unopened $12
Pinball Construction ECA $12
The Seven Cities of Gold ECA,unopened $12
Hacker Activision $7
Seastalker Infocom,unopened $8
Conflict in Vietnam MicroProse $8
Zaxxon Datasoft $8
The Keys of Acheron,unopened (need Hellfire Warrior) $4
Pacific Coast Highway Datasoft $4
Slime Synapse,disk only $3
Trains Synapse, disk only $5

System Software
+++++++++++++++
DOS 2.5 Atari,disk & manual $3

Magazines
+++++++++
Articles from 5 Issues of Micro (serious treatment of Atari) $2
4 Computes (7/86, 10/86, 11/86, 12/86) $2
AIM Magazine (ST & 8 Bit) (10/90, 11/90, 1-6/92) $4

FREE Software
++++++++++++
6 tape programs various $0 - you pay shipping

Or willing to trade for Jag Games (ooops, now you know where my new interests lie) - Let's Make a Deal!

It was released for the 2600, the Coleco, and Intellivision that I'm sure of. Also for the C=64. (All of those are 8-bits. :))

I don't think there was a 7800-specific version, and I'm not sure about the 400/800 as I can never find one with a power supply.

I guess they don't advertise in the UK. Over here, you can't turn a
TV on without being bombarded by ads for the Atari Jaguar. I'm
getting quite sick of the one for Alien vs. Predator.

Odd that someone mentioned Commodore as one of the companies that
advertised. They didn't have any commercials over here for years and
years. Last one I remember was around '89(?) with Tommy Lasorda of
all people showing a kid how cool Amigas are. Nothing since then.

Joe
PS - Do The Math! - Atari Jaguar slogan. Apparently they use
pentiums, so the console can't do the math itself.

NO! you don't want the 2600 burgertime, it REALLY sucks, I got it at a
flea market for a buck or two, and I'm not sure if it is worth it. If you
want burgertime, get it for intellivision or colecovision, or TI-99.
That, and half the time the cartridge locks up. (cart is OLD and bad
condition).

>Atari's in a weekend or two. :-)
>

Although I have never used OS9 directly, especially as it became
most popular on the Coco, but it was originally developed on 6809
based SS50 bus systems which more or less did exactly this,
hardware wise, though not driven by interruot signals per-say.

The basic idea was take the upper 4 address bits, and use them to
address a 16x16 bit bipolar high speed ram, the output of which drove
the actual address bus. A remappable memory management system.
The straightforward extension was a second 4 bit wide memory,
giving remapable access to a 20 bit address bus. Not so very
different from the bank switching in the Atari, just spread
thruout the address space.

That hardware, and a few interrupt routine to handle context
switching is all one would need to handle the task switching.

Well, it isn't so much straight quality. I mean, some really high
grade rag bond can run upwards of $1.00 a sheet, but that stuff is to
rough for this type of printing.
What is needed is smooth paper. The stuff I am using is Wayerhauser
first choice premium laser paper...that is the product name. The item
is 1176.

Please let me know how it turns out. :)

-Joe

Ps: did you get the driver disk and ribbons for it?

Note the underlined chip references.

The 6502C was used in the Atari, and is basically an ordinary 6502
but with some logic circuitry for the timing signals internal to
the processor, allowing Atari to eliminate some circuitry and
simplify their motherboard (in this area). The simplified timing
was useful enough to others that it was implemented as a chip
version.

From what I have read on this thread, the 65C02 (note the C is in
a different position) has some additional instructions added to
it's instruction set, but is pin compatible with the original
6502, and hence not pin compatible with the 6502C.

ATARIO reads the A: drive on the IBM PC. If there is an Atari (don't
ask me what formats are supported, I think the documentation says)
5 1/4" disk in there, it'll tell you what's on it, and let you suck
the files off, onto the PC. The first time I did this I thought it
was so cool- I took the files off the PC (via 3 1/2" disk) to
my 1040 STe, which has ST XFormer. I couldn't believe it worked.
Anyway, if you need to read off of the B: drive, you can recompile
the ATARIO source (Turbo Pascal 3) with a slight modification- I've
tried this and it works. What I'd really like to know is if it's
possible to write to an Atari disk in an IBM drive.

ATARIO reads only true double density:
ATARIO is a TURBO Pascal program to read on an IBM PC true double
density diskettes from an ATARI double density drive. That is to say
it will not read diskettes created on an ATARI 1050 drive in "density
and a half" mode. This restriction (and the inability to read single
density diskettes) is due to the IBM PC diskette adapter.

I would love to see a program that could read enhanced or single
density disks.

Source record: 96211

Whats wrong with discussing multi-tasking? Because I have heard it all before from Amiga owners that 'only Amiga has true multi-tasking'... that I want to puke. Plus the people who split hairs between multi-tasking and task switching. Geez, gimme a break. I took computer science opoerating systems and multi-tasking was a way of giving each program of a batch run of programs a portion of time to run in ... time slicing. We wrote for the IBM 370 and each task had 64K to run in, with calls to the supervisor to set a process going, and the blocks were protected. Its fun to do. Like watching the train go around the track. But where in a lot of these messages was any mention made of the 8-bit atari. No effort was made to even relate any part of the discussion to atari, in the particular message which I complained about. Why don't we discuss virtual reality software or the CD market instead? (maybe someone will relate it to atari for us). Anyway since this newsgroup is unmoderated, forgive me for my pretentious moderator-type attempt at humor.

Atari video is not interlaced, so you get a complete redraw every
1/60th of a second. NTSC TV signals only redraw half the lines every
1/60th, giving 30 complete screens per second.
(And that has always made me wonder how tape<->film transfers can
look so good, since film has a 24 frame/sec refresh rate.)

No need to be like that ;)
The way I understood it, Atari only have a limited amount of monetary backing.
Their recent deal with Sega should help them a bit in that respect, but it
takes money to market a new machine. Take a look at that "Why doesn't Atari
advertise more thread", if they don't advertise, they get slammed. The way
I heard it was that Atari decided to put all it's resources into marketing the
Jag, they quite simply didn't have enough to market both the Falcon and Jag
together.

In a message dated 12-14-94, Graeme Fenwick said:

"I heard the Falcon isn't even being made any more, because
Atari needed the production capacity to build Jaguars."

Extremely unlikely, since Atari itself has *ZERO* production capacity, having sold its factory before the Falcon went into production.

Since then, all Atari manufacture has been subcontracted out. (As some may recall, one of the excuses given for the delay of the Falcon was poor QC on the part of the first factory contracted to produce it).

IBM is responsible for manufacture of the Jaguar. Given how much Atari trumpted this fact, there can be little doubt the Falcon was/is manufactured by another company.

That said, it may very well be Atari is manufacturing no more Falcons. They tend to contract for a "batch", and then sell from inventory. Given current (lack of) demand, likely their inventory on hand has been sufficient for some time.

Getting back closer to the topic of Atari 8-bits, many times it was rumored that Commodore had "stopped producing the 64". And indeed, at that moment, it was true, and remained so until stocks ran low. Only a company whose demand exceeds supply need continously run production.

Back on topic, I will wager that most folks who purchased an Atari 8-bit computer new in after '88 or '89 will find it to have been manufactured in '87 or earlier. (The date code on the chips is a good, but by no means, totally reliable, indicator. Typically they will help pin down the year the computer was made, but may have been in stock themselves for several months prior to being installed on the PCB).

Thought I'd throw out some name of people I did Atari stuff with back in Chicago in the 80's and see if any of you know them or are them...

Matt Walsh (me)

Jim Dinopoli (Jim Din), Libertyville - famous for fixing Bruce Lee so you can actually win

Tim Ferris(?) - older guy in Wheeling who had everything ever made and would trade software for cartridges. You couldn't pick out a game he didn't have; even the most obscure game that showed up once in an Antic ad and he'd have it.

Matt Stanic, Libertyville - had a problem with Jim Din. Weird british accent even tho he wasn't british.

Dave Certa - Orland Park; his parents owned a video store that sold Atari Stuff

Aeron O'Brien - Palos Park

BBS's:
-Matt's Bar and Grille; shut down by feds due to phone phraud.
-Blue Max; lots of AMS and old software

MTM 'Matt the Mentat' Walsh ^^ mtm@walsh.dme.battelle.org

Visualize Impeachment.

Not speaking for Battelle.

UTIL runs on the MSDOS system, and can read/write Atari disks formatted
in true SS/DD (180K). If you get dskutil.arc (the new and improved
version) downloaded and unpacked on your PC, just enter util and it will
give you the various command options.

ATARIO is a separate program unrelated to UTIL.

UTIL both reads and writes SS/DD 180K Atari disks on a PC running MSDOS.
The Merit/UMich filename is dskutil.arc for the latest version. I belive
it's in the 8bit/Diskutils subdirectory.

You have to replace the ROM. When you format an Atari drive, all the
major stats like maximum number of tracks, step rate, ... are all
stored in the drives ROM as allowable options or not. So, with a
new ROM you can tell it 80 vs 40 tracks. I may have a couple of ROMs
I burned with the Bob Wooley modified specs, but if you have the bucks
I'd recommend the CSS upgrade.

The two most frequent problems that'll cause it to lock up are: Leaving
MULE.COM <the Atari side> in the say directory as MULE.EXE <the IBM side>.
MS DOS invariably tries to execute MULE.COM & chokes. The other problem
is busted files seem to be circulating. I believe the file length
should be 14,304 bytes. It's not ANSI C, but all the code in there
is legal calls of Borland stuff so there shouldn't be anything that
could crash a system.

(Erik Petterson talks about connecting a Black Box to a 130xe.)
You seem to be mixing a 386 and a 130xe. You said you were connecting
the BB to a 130xe in the opening then talked about wires to a 386 and a
EGA monitor. Erik, have been hitting the Sven sauce?

Thanks for all the help. I kind of thought I remembered holding down the option key on the 130XE a long time ago and I tried it but it didn't work. I ran the internal tests and guess what? The OPTION key is broken.

Anyone have an old 130XE for sale? :)

Thanks for all the responses!

7507. Atari 1450XLD and other Atari collectibles

Newsgroup: comp.sys.atari.8bit

From: naina@technet.sg
Message-ID: <3cr0ct$kl6@raffles.technet.sg>
Source record: 96236

Anyone out there who has got the Atari 1450XLD? This beast was basically a Atari 1200 with dual disk drive. Atari discontinued this after manufacturing a few thousand of this. It newer actually sold it publicly. I actually saw one in an Atari retailer in Eugene, Or and wanted to buy it. But the owner refused to sell it, saying it was a rare prototype model.

I'm looking for any and all unusual Atari 8-bit machines and peripherals like the 1450XLD, the Atari expansion chassis and other similar items. Email me offer.

7508. Re: Transferring Atari disks to PC

>>density disks.

>Have you given Rick Cortese's Mule utility a try? The Mule files are
>also in the Diskutils subdir. at Merit/UMich.

The problem is that Mule isn't for reading 1050 formatted disks--it's
limited to transfering small files from the Atari to the PC using PC
formatted disks. I would like to be able to read standard enhanced
density disks on a PC without having to do anything special on the
Atari side (VERY useful if your 1050 dies).

--PC

For reference, here's what the Mule documentation has to say for itself:

How it works, you format a double density disk (do not use high density)
on the your IBM, be sure to format the disk for 180k (read your IBM Dos manual
of use one of the many 3rd party formatters). Next you copy the file you want
to transfer to a second disk (Mule will only read and write to D1:), select
read from the menu and wait until told to insert the Mule disk. It works much
the same on the Atari side, format the Mule disk, copy from the default drive
and write to the Mule disk. Once written, you take the disk to your other
machine, load the correct version of Mule for the machine you'll be using and
select read from the menu. After the file is read, you'll be prompted to insert
a default disk to write to. Mule has been tested on text, binary and archive
files and all files survived the transfers.

Okay, the drawbacks. You can only transfer one file per disk, and the
file loses its name in the process. Mule always writes a file named Mule.dat
so you'll have to remember the name of the files you transfer. The other
drawback is that you're limited in file size, about 24k, the author states
that there is no reason that the program could not be modified to handle
larger files (34k). File size is limited because the complete file to be
transferred is stored in memory, there are no multiple read and writes.

One thing to note, Mule is really just a demo to show that such a
transfer can be done and as such the program has not really been fully
developed. Still, it does everything it sets out to do and does it well.
If you've been trapped by not being able to transfer files from your IBM to your
Atari because of a lack of double density drives, then you'll want to give
Mule a try.

The Suburban Chicago ATarians (SCAT) user group will hold its December meeting/Christmas party on Tues. Dec. 20 at 7:30 PM at the College of DuPage, Room SRC 1046 (at the North end of the cafeteria, which is at 22nd St. and Lambert Rd., in Glen Ellyn). We will have our Elections and our annual Charity Benefit Auction, and generally just munch on goodies and have a good time. (There will probably be a Jaguar set up, so if you haven't seen one of these, you just gotta come!)

Everyone is welcome to attend. (Especially anyone who is thinking of joining SCAT :-) Remember, SCAT memberships are FAMILY memberships, so feel free to bring your family.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

Message-ID: <belitz.124.000A0A92@genesis.informatik.rwth-aachen.de>
Source record: 96252

Hallo !!!!

Yesterday I tried to get some files from the mirror-server in switzerland.
The only file I found was a "README" in the ATARI-PATH.
They wrote that they won't suppurt the ATARI-Section any longer because they
need the space and this section wasn't used very often.
You should use the "barnone.citi.umich.edu"-server they wrote but in Europe
I would prefer the "src.doc.ic.ac.uk" in UK or
"info2.rus.uni-stuttgart.de" in Germany

Matt

7515. Copying files between a 600XL and a PC.

My primary machine is a PC, but I picked up a 600XL for my brother's kids. My problem though is that I need to be able to write Atari format 5.25" disks on my PC so I can get some software off the inet and over to their toy.

Does anyone out there know of a utility to do this?

Thanks
Keith

Sorry, it`s an PAL-one. But if I remember the scematic for the PAL and the NTSC version is the same (of course there are some notes like "for PAL change ...."), please correct me if I'm wrong ,but you can see the monitor jack . And if you compare it with the 800XL one, you will see the they also had made an Luminace-Signal, but it's not connected.

Greetings Matt

>The pirates didn't help matters, but Warner management and the goons they
>hired to run Atari are what killed Atari.

Yo!

Or what would You say about the IBM/PC pirates today?!?
The ordinary PC user is definately using illegal copies...
So will Microsoft/LOTUS/etc give up PC market ? I don't think so.
It's just because pirating seems to belong to all modern mass media.
Compare to video tapes, compact disk-to tape copying, copying books, and
so on. Even "normal" products are being copied, clothes, parfum, everything!!

We are living in a criminal society... ;)
So, what do we need?? Better protection? More laws? Cheaper products so
that pirating will become useless? I don't know...

By the way, do You remember when back in the 80ies ATARI computers were
considered to be game machines, whereas the IBM PC was the "professional"
biz machine?? Hohoho, if those fools could have seen todays game market
for the PC... ;)
Sometimes I think the evolution of intel's cpus is just carried on to
make possible faster and more complex games, better graphics and
incredible sound...

Ok, that's another story...

Bye, MC.

Following on from the ATARI - IRATA naming of planets in MULE etc

A company called RED RAT SOFTWARE here in the UK released a game
called Laser Hawk, that I believe was written by Harvey Kong Tin, who
later co-developed Hawk-Quest.
Laser Hawk is a horizontal scrolling shoot em up, with good graphics
and sound, however in the intro story it talks about you taking on
and destroying the evil PROC IRATA, and what is that backwards??!!

Also quite interesting several years later when it was re-released
on budget tape all the references to the PROC IRATA had disappeared!

From: krishna@max.tiac.net
Message-ID: <3csa1a$kra@sundog.tiac.net>
Source record: 96247

There may be good news on the emulation front for Amiga owners.
I'm waiting for more specifics from Jim Drew, but according to him, the
Atari 8-bit emulations are essentially done. Long ago he told me that it
would support 400/800 _and_ XL/XE but you have to take his claims with a
grain of salt. The big news is that he said that these emulations will
be free and will NOT require the Emplant hardware. Whether this means it
is only a bonus for existing Emplant users or will be available to all
netters, I'm not sure, but I think him saying it won't require Emplant
means that he expects those who did not purchase Emplant to get the
program and run it.

XF3 owners I'm sure will be interested in knowing how close Jim
Drew and co. have come in emulating the Atari8 on a far more analogous
archetecture than the PC, and what kind of minimum configuration would be
necessary to acheive 1:1 throughput.

In addition to the print spooler usage that has been mentioned in
this thread, there is the rapidly spreading background email
handler. Here, excluding non-singleuser computers, I would say
that well over 75 percent of all computers run a continuous email
program in the background while doing other tasks in the forground
generally word-processing or data base access, but even if
someone is using the email software to read his/her mail, the
email background process is a second process running in the
background, separate and independent (relatively). And quite
frequently on 8086 PCs running old fashioned MSDOS.

I think part of the problem is that things have gotten so far from
requiring user knowledge, that users are not even aware that their
computer is actually doing more than one thing at once. As an
example, Word Perfect for DOS has a print spooler built into it,
independent of any DOS based spooler. My wife is always printing
out her multipage documents for school and continuing on to
another document. If one asked her, she would say she was only
doing one task at a time, when in actuality her computer is indeed
multitasking.

Not really, so far I've just given 4 away. Since I've modified the
design <a few cheats/hacks> it only cost me a couple of bucks to make
them. I'm starting to run a little short of serial cables & I don't
want to buy them just to cut in half. I have enough parts to make a
few more. If you want to send me an Atari serial cord & let me keep
the extra half I can make you one. It won't be in a box though, just
the board with the cables connected to it, boxes are to expensive!
Be forwarned though, I'm incredably cheap so I may scavage a board
from another project. It'll work, but it won't be pretty. The price
is certainly right<g>.
Rick

Preston;
Actually I've seen programs that handle 26 sector/track MFM data on peecee's. It's just that they were written for doing CP/M transfers to MS DOS. The program(s) are 22NICE, a MS DOS CP/M emulator, & 22??? which reads/writes about 190 types of CP/M formats on an PC. Actually, it won't do all 190 on a stock pc disk controller since they can't do FM type disk. Sorry I don't do more with Mule.exe, but I really have every other option available already. To figure out how those 22NICE authors hacked the 26 sector MFM code would take me weeks of hacking in DEBUG or CodeView. I'll take another look at 22NICE though & see if it'll tranfer a complete disk to a MS dos disk or file.

>Rick

22nice is a CP/M emulator. Not very useful for us, but it mentions
another program that reads the disks...

22dsk142.zip. As you state, it's primarily for CP/M disks.
The documentation states:
22DISK currently will not handle "hard sectored" diskettes, nor will
it work with diskettes written on an Apple][or Commodore 64 or 128.
However, it mentions another program...

AnaDisk. This seems to do what we want. Among other things, it will
dump a raw disk to a file, for disks in almost any format. FM disks
may require some hardware modifications to your drive controler. I'll
see if I can get the enhanced density disks dumped (then it's
relatively trivial to turn them into SIO2PC disks, which is what I
really want), and then report back to the net.

7530. Atari 8-bit 2005

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 05:23:40 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <JI31nGc.ransom22@delphi.com>
Source record: 96111

I was musing yesterday about the longevity of Atari 8-bit computers.

To be blunt, will we still be using them in 2005? 2015? Beyond?

On the one hand, as long as the hardware and software holds out, nothing will change the fact that they play the games we like, do the tasks we need them to, are fun to program, and all the other reasons we gave for using them today. So, why would't we be using them ten or twenty years from now?

On the other hand, who knows what sort of things people will be doing with computers then? I mean, in 1979 a humongous supercomputer was the only thing equivalent to today's Pentium machines. Things have come a long way, and show no signs of slowing. Who's to say that Pentiums won't seem like archaic child's toys fifteen years from now? And what will that make our beloved 8-bit computers?

Will there come a time when our 8-bit Atari's will be so archaic as to cause us not to use them?

Just some idle thoughts which, of course, we have no answer to. But, something to think about . . .

-Joe

Clone software developers jack up their prices to make up for piracy.

In the olden days, that trick wouldn't work because people had a lower tolerance for price gouging then.

Also, they still make money because even if 90% of the users pirate, that's still an enormous amount of good people in that 10% who will pay their dues. So effectively what the pirating quotient is, is invalidating a portion of the userbase. With a shrinking userbase which was that of the atari8 at the time, whatever percentage of 8-bitters pirated became the "useless userbase" to developers. Therefore even if on paper you had enough people in the userbase to develop for, once you factor in the high pirate quotient, you drop down to nil.

Nobody left the Atari8 out of some personal thing against it. I think it was sheer economics.

>We are living in a criminal society... ;)
>So, what do we need?? Better protection? More laws? Cheaper products so
>that pirating will become useless? I don't know...

The only way to stop pirating by lowering product prices would
be to lower them to below the price of copying . . . which would be
impossible, of course...

I dunno what the solution is. I tend to say "education" is the
solution to many problems....but I don't know.

>By the way, do You remember when back in the 80ies ATARI computers were
>considered to be game machines, whereas the IBM PC was the "professional"
>biz machine?? Hohoho, if those fools could have seen todays game market
>for the PC... ;)
>Sometimes I think the evolution of intel's cpus is just carried on to
>make possible faster and more complex games, better graphics and
>incredible sound...

Essentially, it was the popularity of the Atari computers that
caused them to be game machines. It doesn't pay to make a game for a
machine that has a small instaled user base, esp. when Commodore and
Atari had such HUGE installed user bases.

Only when the price of the MS-DOs machines dropped (thanks to
clone makers, mostly) that that platform became viable as a games
market. I know, there were games for the MS-DOS machines all along,
but they were all ports of games originally developed on other systems.
The original games didn't appear until later . . .

You're right . . . We could just as easily say now "Oh, the MS-
DOS/Windows platform is just for games! If you want a REAL computer,
buy a Sun workstation." :)

But who wants a "real" computer anyway? :) I'd rather enjoy
my computer in as may ways as possible, from improving my life through
applications, to providing entertainment for me.

Gorf is a 400/800 cart only, run a translator before inserting it. Its
tricky trying to insert the cart w/o crashing the computer, but it
can be done.

Best thing about the pirated version of ROF is that you can advance levels
by holding down SELECT and pressing reset! Upto level 99! Im not
100% sure its SELECT, it may be start/option?

7538. Re: MIO II still available?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 15:49:45 UTC
From: F Tooned <ftooned@delphi.com>
Message-ID: <ZQx0fGZ.ftooned@delphi.com>
Source record: 96135

Hendrick,

The MIO II hasn't been shipped yet. The boards will be going into final
production this week. The Sweet 16 boards are finished, and WILL be shipping
during the next week. The Sweet 16 will sell for $69.95, and is a plug
in 65816 replacement for the Atari 6502C processor. It will be bundled
with a full Atari 65816 assembler and editor, along with programming
examples, and utilities.

FTe will be sponsoring a 65816 programming contest through May '95,
and is offering some pretty amazing prizes. (more later)
Most of the new code development here will be based around the '816,
including plans for SpartaDOS "816". Check out the December issue
of Atari Classics for a full review, along with a new series of
articles and projects for the '816 written by Bob Woolley.

It's been pretty busy around here and the phones have been down
for the past couple weeks. A new voice mail system has been installed,

and things should be back to normal by the first of the year.

Merry Christmas everyone. Thanks for a great year!! Mike

7539. Re: How can I reach FTe?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 15:54:29 UTC
From: F Tooned <ftooned@delphi.com>
Message-ID: <ZQx3fwV.ftooned@delphi.com>
Source record: 96136

Rob,

FTe can be reached at PO BOX 66109 - Scotts Valley, CA - 95067

or (408)438-7325 (voice) or (408)438-6775 (FAX) or E-MAIL at above address.

We have installed a new voice mail system here in-house, so the phones
have been down for the past few weeks. The Sweet 16, and MIO II will be
shipping very soon, and we wxpect things to get back to normal by the first
of the year... Mike

In reference to the archaic child's toys, the IBM XT and PC 5-slot are
just that. You can get parts for them even cheaper that the atari 8-bits.
They make damn good word processers and dialout computers and number crunch a
lot better than you would think if you can find a mathco for one of them and
a V20 chip (processor replacement that was 10-20% faster and probably cost
over $100).

I know idiots who payed over $3000 for computers that they watch download
files all day (of course dowloading requires mass amounts of processor
overhead ^_^). I can do more with an 4.77 MHZ XT or an atari 8-bit than
they could dream of. I think everyone who reads this newsgroup can
probably say the same thing. If you know what you are doing, you don't
need anything fancy if what you have doesn't limit your computing ability
in any way.

> Will there come a time when our 8-bit Atari's will be so

No, I have an 800 which I'm giving to a friend for christmas because his
400 died 10 years ago and he saved all of the cartridge games because he
still wants to play them.

>Mike intends to have the physical drive appear as two logical drives, each
>half the size.

Dave,

Actually the problem of using half the drive stems from IDE drives
having a 16 bit interface. (A few use 8 though).

There are no plans to support 2 distinct parts of the drive.

The MIO II will be released to support half the drive, and another
version is being considered to support 1 full drive. There are
hardware difficulties to consider, and we felt is was better to
get boards out in public rather than waste another 4-6 months
deciding if 16 bit access is really that important with the LOW
cost of the new IDE drives...

7543. 'Util' and file corruption

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 16:27:47 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Dec17.112243.15719@wariat.UUCP>
Source record: 96119

(Russ Gilbert, blah, blah, blah.)
I wanna verify that 'Util' unpredictable corrupts files with the
'util /w /b filename.ext a:' command. Mr. Cortese said I may not have
been using the correct (whatchacallits, /w or \w, /b or \b or
forgetting to put /b in.) I did, and the file I was transferring got
corrupted the first time, the second time (using doskey, so I know I
gave the same command both times) it wrote ok. So, be sure to use
'crc16.com' on both ibm and atari if you want to make sure you got a
uncorrupted 'util' transfer.
Now, M. Current says R. Cortese, I think, uploaded a updated 'util'
to 8bit/Diskutils/dskutil.arc, which I downloaded and it looked the
same as the one I had. I didn't see a new 'dskutil.arc' in the new
uploads list from J. Lenn.

7544. Re: Transferring Atari disks to PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 18:22:04 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <129598@cup.portal.com>
Source record: 96134

I've fooled around with the CP/M emulator & what seems to happen is it reads the files CPMDISK.DEF for both the emulator & CPMDSK. It gets the data for sectors & tracks from the table so once in the emulator it can be configed for any of the CP/M disk. There's also a progam to detokinize the CPMDISKS.DEF & I think it could be 1/2 as simple as just adding a new definition to the tables. They actually have an ATR8000 defined already. The reason why I say 1/2 is the Atari disk are written in inverted form. In order to make any sense out of the files they have to be EOR'd with $FF. The other program you mentioned I `think' is commercial, & from Australia. You'd have to find out more about it in the CP/M sig.
BTW: If you have a Micro Solutions Compatacard you're supposed to be able to do single density also. I have one but it's configured as my secondary controler so the software doesn't recognize it. If you need help inverting the file on the IBM side with EOR's let me know & I think I'd have time to knock out a quick & dirty to get it done.
Rick

7545. Atari XMM801 Printer Notes

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 22:11:18 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <hm93v4e.ransom22@delphi.com>
Source record: 96120

About three months ago, I had asked about the specifications
of the Atari XMM801 printer. While I did get some information, I didn't
get answers to all my pesky questions. :) I then called BEST, and
asked Brad how fast the machine was. He said, "Slow. If you want fast,
buy a Japanese printer." When I asked what the exact CPS was, he
said he didn't know offhand.
Well,they were only $99.95, so I bought one without really
knowing what it could do. Since my goal for the past few years has been
to own at least one of each of the hardware devices produced by Atari,
I figured if it didn't work out it wouldn't be too great of a loss.
Anyway, presented here are all the specifications on it I could
find. Since Brad sent me a brand new, in the box, never before opened
XMM801, I do have the manual to refer to. :)
Essentially, what I wanted was three things out of this printer:
Something faster than the 1025; graphics capability; and the Atari brand
name (sure, I could hook up my Panasonic KXP-1124 and get some GREAT
speed, but I'd rather use an Atari device). Those three things are
exactly what I got. If that is all you care about, then read no further.
But, if you are like me and want to know more, read on.

Atari XMM801 Printer Data:

Printing Method: Impact Dot Matrix
Printing Speed: 80 characters per second at 10 characters per inch
Print Direction: Bidirectional with logic-seeking capability
[So, even tho it is nominally only twice as fast
as the 1025, since it prints bi-directionally while
the 1025 does not, you do not lose the carriage
return time with the XMM801, making it even faster.]
Number of Pins: 8 [Okay, not so great, but . . . better than the
1025's 7 pins]
Character Matrix: 8 dots high by 9 dots wide

Character modes:
Noninternational: Full 96 ASCII character set
International: 91 ASCII and 36 international characters

Graphics: 8 dots high by 480 dots per line at normal
density (960 dots per line at high density);
dot addressable

Horizontal pitches: Pica, Double Width Pica, Elite, Double Width Elite,
Condensed, Double Width Condensed

Line Spacing: 1/6 inch unless programmed otherwise

Line-Feed Speed: Maximum 5 per second at 6 lines per inch
Paper-feed method: Sprocket feed or friction feed
Paper-feed direction: Forward
Overall paper-width range: 4 to 10 inches

Paper thickness: .002 to .006 inches; one original plus one copy max.
Paper types: Fanfold pin-feed paper and single-sheets
Paper entry: Rear
Ribbon: Cartridge containing multi-strike carbon film ribbon
with life expectancy of one million characters.
Buffer Size: 80 bytes
Interface: Atari standard serial

Physical characteristics:
Height: 4-1/2 inches
Width: 15-1/2 inches
Depth: 11-1/8 inches
Weight: Approximately 10.1 lbs.

Still with me? Good. :) the above is taken directly from
Owner's Manual.
The following is stuff I found out in using it, or by other
research:
It is capable of reverse-feed. For instance, it uses this when
printing in two columns; it prints the first column all the way to the
end of the page, then reverses to the top, and prints the second column.

It is capable of using all of the AtariWriter/Atariwriter+
print features and modes. It does underline and boldface printing.
It also does superscripts and subscripts (very readable!).
The ribbons print REALLY nicely. While normal nylon-type
ribbons are available for it, the carbon-film ribbons give a much
nicer image,and don't dry out. :)
Ribbons cost anywhere from $8.50 to $9.95, depending on where
you shop.

Essentially, this printer is the 825 with faster printing and
graphics.
Oh, and the descenders aren't TRUE, per se. They do go
one pin below the bottom of the other characters. Normal printers
go at least one more pin lower. But, this does alleviate the "smashed"
look you get with 7 pin printers.
Using the XMM801 Print Shop driver available from B&C Computer-
visions, I tried out the printer's graphics features. It comes out
very nicely, if slowly. Lines are well-formed, dark and clean. Pictures
come out well, considering it is a printer from 1985 -- not something to
show the boss, but nothing you would be ashamed of showing to friends
and family members. :)

That about covers it. If there is anything that I didn't cover
in these notes, tell me what you want to know and I will try to find
out.

Thanks for reading,

Joe

One crucial difference between the IBM machines and Atari was that the IBM machines used fairly open architecture. Just about all of the chips were literally "off the shelf", and there were no proprietary chips - outside of the ROM - and even that was hacked by the clone makers.

Atari used proprietary custom chips (manufactured by Ferranti, if I remember correctly), much like the Mac. Thus, they could not be legally cloned; the GTIA, Pokey, etc... chips were far too specialized in the Atari. If Atari would have gone the open architecture road, I suspect that Windows would not have been the hit that it is, since the ST and Mac had them long before Bill Gates conceived of it.

> Atari had such HUGE installed user bases.
>
The reason that Ataris were popular was because the games were so unlike those ascii wonders in the IBM world, the graphics on the Atari 8 bit (and ST) were clean, sharp, extremely colourful AND could connect to any TV.. BTW, just as an aside here, I was looking through an INMAC computer catalogue and found a unit that hooks up to an IBM clone that for a mere $399 allows you to connect to a TV....dejas vu or what!!! ;)

7548. What is SIO2PC???

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-17 23:57:32 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELSMEEUSUp@stingray.manawatu.gen.nz>
Source record: 96121

What is SIO2PC???

I have only recently joined this group, and would like to be able to transfer files between my ST and my 800XL (as soon as I can fix it - it died recently)

Is there a way to do this? I don't have the 850 interface - is that right? Sorry - running from memory on that one. But I would like to be able to knock up some kind of interface to connect the 2 ataris.

I wired up a serial cable a few years ago that connected my XF551 (???) drive to my ST, but it doesn't use the same storage method which is no good to me.

Basically, like everyone else I guess, I want to be able to ftp files across and then send them to the 8 bit. Actually, if the transfer rate was high enough, I'd like to maybe use my ST as a virtual drive perhaps?

Any help would be appreciated.

Richard =8-]

PS. Anyone selling an 8 bit - pref. 800XL or 130XE for a sensible price in New Zealand? I can't buy a US one because we use PAL, and don't want to send overseas if I can help it.

Source record: 96123

I have a couple of nice 720K 3.5" add-on drives I'd like to sell,
price is $40 each + shipping.

I tested these drives as slaves to Percom drives, they work great.
They should also be suitable for use as slaves for the CSS upgrade for
the XF551.

These are not bare mechanisms, they nicely mounted in a metal case with
their own power supply. The case color matches the XL perfectly. The
mechanisms are made by Sony (which is the same brand sold by CSS for their
551 upgrade).

I also have a few bare Sony 3.5" 720K mechs to sell for $30 each for anyone
who might want to stuff one into a Percom or XF551. You can't find 720K
mechs any more, & using the newer 1.44M mechs sometimes doesn't work
right.

>That brings up an interesting question: how long will the hardware likely
>hold up?

Dunno. Good question.

As I see it (NOTE: I am not an expert on hardware lives), the
real problem for us will someday be disk drives. At least that will
probably be our first problem. There are plenty of printer interfaces
out there that will let us hook up any standard printer, so those won't
be a problem. And the chips in the machine have very low failure
rates after the first few days of use (right?). but disk drives fail
due to their mechanical (rather than electronic) nature,and we need
very specific disk drives which just aren't manufactured any moe.
er, more. :)
I guess at some point we'll all have to switch to black boxes/
MIO II's and using hard disk drives (which should be avaiable for a
good number of years to come...grin).

Any comments from those who know more about this stuff? As
this is of vital interest to us all,I'm sure the informatin would be
much appreciated.

>probably say the same thing. If you know what you are doing, you don't
>need anything fancy if what you have doesn't limit your computing ability
>in any way.

Alas,most people don't know what they're doing (this group's
readership excepted, of course![G]).
But you are so right...my 286 runs the BBS at 14.4Kbaud just
fine. It has one megabyte of RAM, a 20 megahertz CPU (which is really
overkill), and a 540 MB IDE HDD. No one complains of the slow
speed... :)
Down the road there's a guy running a board on a "spare"
486-66. Same BBS software as I have, but a MUCH more expensive machine.
He has an SVGA monitor and card hooked up to it. I use a mono
monitor and card (sure, I have color on my BBS, but I don't need to
see it on a regular basis..and I can always call in when I do need
to see it!).

But to get back to te 8-bit world, AtariWriter fills all my
wordprocessing needs. SynCalc does fine for my household spreadsheet.
I keep informatin on my Atari 8-bit and classic videogame collections
just fine with SynFile+. I track my stocks just dandily with SynCalc
and SynTrend.
Sure,I could do all this on a Pentium-90 with Windoze and
Paradox (Database), WordPerfect, and Lotus 1-2-3, but why?

:)

Besides, if I *did* do that on my pentium, my household spreadsheed
wouldn't calculate properly! :)

"That trick *never* works" - Rocket J. Squirrel. :)
Yes, looking at the old (1983-85) issues of Antic, Analog, and
(1982-84) Electronic Games, I am amazed at the prices we used to
pay for games. I had forgotten that a brand new 2600 cart used to be
$25-$30! Imagine a brand new, hot Nintendo cart going for that now!
Try $80!
The same price increase is seen in the computer world.
My theory: As acceptance of computers grew, the userbase
became skewed toward those with higher than average incomes, so the
market could bear those prices. In the good ol' days, you didn't hve
all that ready cash available for developers to pluck.
Just a theory, mind you, with no facts to back it up. :)

ABsolutely true. CGA doesn't hold a candle to Atari 8-bit
graphics. Even EGA doesn't compete when you consider the display
list tricks that can be done on an Atari. And nothing beats built-
in sprites/players.

>BTW, just as an aside here, I was looking through an INMAC computer

> The only way to stop pirating by lowering product prices would
>be to lower them to below the price of copying . . . which would be
>impossible, of course...

Not necessarily. After all, small-time pirates pay a lot more for
blank media than the manufacturers of the originals do.
Once you decide to actually pay the author and all the middlemen,
however, the price goes up. Take out a few middlemen and a lot of
packaging and you can afford to charge a price closer to the cost of
copying.
We all hate the "software bloat" that has come with machines that have
lots of memory and lots of disk space, but it seems to have become a
form of copy protection: People are unlikely to copy a program so
big you have to load it from CD-ROM, except by copying from the
original. Multigenerational copies are very difficult from CD-ROM.
It's also a lot harder to copy a program that's distributed on 10
floppies than one that fits on one floppy.

> I dunno what the solution is. I tend to say "education" is the
>solution to many problems....but I don't know.

I doubt it -- most people know that they shouldn't be copying, but
they don't care -- they don't see any reason to buy another copy if
they can just make a copy themselves, especially if the program costs
hundreds of dollars. People are always going to copy software, but
they're more likely to buy it if they think they can afford it.

Other than lowering prices, the only alternative I see is somehow
appealing to people's morality. Show them where the money is going
and why they should pay. Threats of legal action don't work in a
society where "unreasonable search & seizure" is (theoretically)
illegal. Saying "you're stealing" doesn't work -- the reply is "I
haven't taken anything away from anybody. Everybody still has
everything they had before I made the copy."

> But who wants a "real" computer anyway? :) I'd rather enjoy
>my computer in as may ways as possible, from improving my life through

Amazing! I discovered all of this independently. I just checked out mule and that's where I was a couple months ago. After this grand discovery, I decided that it would simple enough to format a PC disk to 26 sectors of 128 bytes each. Yeah, right!

That very night I wrote a quick assembly program to perform such a format. No problem, right? Well, I tinkered with this thing forever! If I formatted the disk to 16 sectors of 256 bytes each, no problem! If I formatted the disk to _1_ sector of 1024, 512, or 256 bytes, no problem! If I formatted the disk to _1_ sector of 128 bytes, I can write to the sector, but not read it back. (This is all on my trusty PC, not even on the Atari yet.) I can read the sector as many times as I want after I format it, but the sector mysteriously disappears after I write it. BUT, I can still write to the sector successfully?!? All of these tests work perfectly at 1024, 512, and 256 bytes, but on 4 different machines I tested this on, not one was able to pass the test at 128 bytes!

Finally, I concluded that there is either a fundamental flaw in all PC bioses, or some deity was out to get me. I later discovered 22DISK and wrote a quick description file for it. I noticed it took it a _very_ long time to format, and apparently programmed the 8272 itself. (I tried to rip off their disk parameter block and noticed they hadn't even touched it.) So, once the format was done, I attempted to write sectors to it in my 1050, no luck!

Understandably, I gave up at this point. I have since found a lot of information on the 8272 disk controller and everything appears in order. I haven't yet had the time to write my own format routines, but somehow suspect

that I would run into the same problem.

So, that's where I am. Anyone else able to shed any light on this subject? It isn't possible that 128 byte sectors aren't really supported, is it? Ah, well, if I get some encouraging notes, I might just go ahead and try some old-fashioned hardware banging and see what I can see.

Or rather, if IBM HADN'T gone the open architecture road.

Actually, GEM (as seen on the ST) was available for PC's. I'm not
sure how Windows beat it, but I'm sure it had something to do with the
widespread use of MS-DOS.

I've seen them for about $300, but of course that's still a lot more
than a used Atari (or ST or Amiga). But you can't play Doom on the
XL. :-) Big screen Star Raiders, on the other hand.....

7563. Bubblejet connected to Atari...

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-18 05:56:19 UTC
From: rfunk@magnus.acs.ohio-state.edu
Message-ID: <3d0iu3$nt8@charm.magnus.acs.ohio-state.edu>
Source record: 96146

Recently a few people have been asking about using Inkjet/Bubblejet printers with the Atari, so I decided to try it out and report my results. I hope this is helpful to somebody.

Last night I decided to see how well my new printer gets along with my old Atari software. Since the Canon BJC-4000 is supposed to understand both Epson and IBM codes, I didn't think there would be too much problem, and I was sorta right.....
(I'm not sure how many Bubblejets can do the Epson mode, so YMMV.)

The first program I tried was CASSJKT.BAS, a program to print cassette jacket labels, which I believe first appeared in ANALOG. I told the program I was using an epson (the other choice was Prowriter), and when I set the printer to Epson mode things went OK. In IBM mode the printer didn't space right between lines, presumably because of the slightly different function of the ESC-A command. Now I don't remember for sure, but I think I may have had to set the "Add LF to CR" switch in either the printer or the interface (P:R: Connection) for this program.

Next I tried Print Shop. It printed fine in both "Centronics GLP" mode and "Epson FX, MX, ..." mode, with the printer set to Epson mode. The problem was that it insisted on putting an inch margin at the top of the page, so signs (and presumably other full-page printouts) overflow onto a second page -- about 2 or 3 inches onto it! Maybe some extra-long paper is in order for Print Shop. Or just switch to Print Power.....
The "Screen Magic" part of Print Shop worked better, since it only prints half a page. Just be sure to tell it to print to the top of the page.

I never did get Print Shop Companion to work, which is odd since it copies the printer info from the Print Shop disk. The problem was a severe lack of linefeeds, so it might have worked if I had played with the hardware "CR+LF" switches. I was stubborn, though, and I really don't/didn't use PSC for much anyway, so I moved on.....

When I got Print Power, I almost never used Print Shop anymore because PP seemed like a much better program. Last night this fact was proven once again. I set the printer to IBM mode (aka "Native Bubblejet" mode) and told PP I was using an "ESC-P Epson/IBM" printer, and everything went as well as could be expected. The only snag was that about 1/4" of the bottom border was lost to the margin. Just don't use a bottom border. :-) At print time, PP gives the option of "Final or Draft", but in this case I hardly noticed a difference, except for a few thin stray white horizontal lines in the "Draft"

version. It was a much smaller difference than the dot-matrix
equivalent.

Finally I briefly tried Daisy Dot III. I've never really used DD3,
except to print out all the fonts when I first got it, and as I recall
I didn't even have overwhelming success with my Star NX-10 then. I had
much less success last night. I made a short test document, loaded up
the PP.COM "print processor", and tried printing. All I got was
garbage and formfeeds. I didn't spend any more time messing with it.

Note that it was almost always necessary to take the printer offline
and hit the formfeed button after a program finished sending info to
the printer. In addition to ejecting the page, it printed the last
line of the graphic and set the printer back to a normal ready state.

I have also printed lots of text to the printer with great success --
it understands all the standard text pitch codes (compressed,
double-wide, etc.) just like a dot matrix. Nobody should have any
problems using something like Atariwriter, AW+, Paperclip, or Textpro
with this printer -- just remember to tell the program that there are
only 62 lines per letter-size page, not 66.

I have the following Atari 8-bit items for sale:

* - denotes Game Title
# -denotes Productivity Title
@- denotes Educational Title
^ - Uitility Title
All are disk based, unless noted other wise.

Software without boxes and have docs:

XLent Word Processor (#)
Juggles House (Cassette) (@)
My First Alphabet (@)
Time Wise (#)
Typo Attack (@)
Home Filing Manager (#)
Family Finances (#)
Bridge 4.0 (*)
BookKeeper (#)
BankStreet Writer (#)
Chop Suey (*)
Stock Market (*)
Atari Speed Reading (Cassette) (@)
AtariWriter (Cartridge) (#)

Software without boxes and docs:

PacMan (Cartridge) (*)
PacMan (Cartridge) (*)
Star Raiders (Cartridge) (*)
CheckMate (#)
Jaw Breaker (*)
World Championship Karate (*)
HomeCard (#)

Software with boxes and docs:

Zork I (*)
Zork II (*)
VisiCalc (#)
Crusade in Europe (*)
Nato Commander (*)
Conflict in Vietnam (*)
Decision in the Desert (*)
Peggammon (*)
BallBlazer (*)

Puzzle Panic (*)
Ace of Aces (*)
Reforger (*)
Fight Night (*)
Blue Team Bridge (*)
Archon (*)
Hardball (*)
Mickey in the Great Outdoors (Cassette) (#)
Interlisp/65 (^)
Financial CookBook (#)
Combat Leader (*)
Home Filing Manager (#)

Books:

How to Program the Atari in 6502 Machine Language
Atari Basic
Compute's First Book of Atari Graphics
Compute's First Book of Atari
Mapping the Atari

Hardware:

800xl no PS and Cables
Supra 300 Baud Modem w/PS,Cable and Software

Parts:

Complete Antic Chip Set
Atari 400 Keypad
26 Assorted IC Chips from various Atari Hardware
items such as xmm-801,xmm-301,810,1050,800xl,1027,850,400/800, all for
$15+
S/H

Please Email me at SERG21@aol.com if your interested in anything and
leave
a price
with s/h included and i will get back to ASAP.

Vince Grienti (ai542@FreeNet.Carleton.CA) wrote:

: One crucial difference between the IBM machines and Atari was that the IBM
: machines used fairly open architecture. Just about all of the chips were
: literally "off the shelf", and there were no proprietary chips - outside
: of the ROM - and even that was hacked by the clone makers.

Most machines of that vintage used custom chips of some type. It was established that game playing was going to be an important part of the machine. No, they didn't realize this with the Apple II, which is essentially a 6502 version of a PC Clone in archetectural philosophy. That's why there were Apple II clones (the Laser I believe). But the TI, C=64, and Atari8 all have specialized graphic chips with hardware sprites. Overall I think that is 'what makes an Atari' and is not something to scorn despite the difficulty of upgrading.

The notion of a "home computer" as defined by these machines was mostly one of integration and simplicity. Due to the fact that between 1977 and 1984 6502s were mostly limited to a fixed clock speed of between 1 and 2 mhz, the idea of a split chipram and fastram archetecture to easy processor upgrading or retargetable graphics/sound was never even contemplated. Even with the Amiga, fastram was almost an afterthought and RTG is a big coinphrase where gfx board manufacturers have had to make many loops to get their rather BORING but utilitarian gfx boards to run with the AmigaOS.

Computer manufacturers realized that the public did not want to have to deal with the 'kit' concept, having to open up their case and mix and match various cards and slots and reconfigure the system and hope that all their software runs. The computer industry led to plug-in technology because of the ACCELLERATED rate of obsolescence in computer archetecture in the last 10 years. Something might remain state of the art for only a year. Commodore was very bold in bucking this trend by sticking by their custom chip archetecture and only upgrading them every few years.

It goes without saying that the downside of Intel box flexibility is also a big pain in the ass for the user to configure things. Hence today we have the inconceivable new occupation of home computer technician. Someone you PAY to come in and change your config.sys. I was over a relative's house when they had a guy come over to do this. It was pretty ridiculous that the computer novice feels okay about having to pay a guy $50 or more to set up his system because it was not designed well enough to be easy to configure.

RG> connecting the BB to a 130xe in the opening then talked about wires to
RG> a 386 and a EGA monitor. Erik, have been hitting the Sven sauce?

Yes. What I mean was that I take the electricity from my 386. I dont own an 220 Volt adapter that gives my BB +12, +5, -5 Volt. We dont have 110Volt in Sweden. So thee BB starts when I push my 386 power on. This is the only way I can make my BB funktion.

It seems that I have burned one of the BB's RS232 chip when I connected all electricity wires completly wrong. The wires on the 110V adapter was mirrored compares whith the written info on the adapter itself.

In The Winter 16.12.94 Wrote Mario Charles following stuff...

MC> Or what would You say about the IBM/PC pirates today?!?
MC> The ordinary PC user is definately using illegal copies...
MC> So will Microsoft/LOTUS/etc give up PC market ? I don't think so.

This is the only way that The PC-companies can sell there machines to let peaple copy from eachothers. There isnt one normal worker who have afford to by any software to his MS-DOS machine as the software is to much expensive. This make those machines to live.

But the piracy on the Atari (ST/Falcon) side is our own death. The latest I heard from one Swedish Pirate is about one new Swedish game called Obsescion. This is a flippergame for Atari STE and Falcon. The Swedish pirates will not crack this game as this only program is wery important for the survivel of this new Software companie in Sweden who have made the game. This is the absolut best game I ever have seen on an STE/Falcon in graphics and Sound.

I'm sorry about this off topic. But there is a big differens between Piracy on the PC-side and Atari-side.

1. You must have Piracy on the PC-side so the companies can sell more computers to ordinary peaple.

2. The Piracy on the Atari-side is killing The Atari Software companies.

I can also inform you that there wasnt only a few Atari sellsman left in Sweden for 2 years ago. Now evrything looks completly different. There is some new companies here and they work together under one name. ACC. This looks very god. But not on the 8-bit side.

I've succeeded in reading a 1050 enhanced density disk on a PC!!!

Well, sort of.

I used Anadisk, which is a disk utility by the same people who did
22disk. I just put in the disk and told it to read it. There's no
configuration, other than telling it what sort of hardware you have
(only necessary for pre-AT's). It's a really slick program

It correctly identified it as double density (MFM), 128 byte sectors,
26 sectors per track, 40 tracks, 1 side. I figured out the
track/sector for sector 361 (the directory), and read. I had to then
use the "Not" function to invert all the bits, and then I saw the
filenames I expected to see! Unfortunately, the second half of the
sector was garbage. I attempted to reread the sector, and it either
read about a third of it, or half, but never the whole thing.

Also, it gave some other weird diagnostics about missing sectors and
such. Unfortunately, I don't have a working 1050 to verify that the
disk is good.

This was on a generic 386-20 with a 1.2M floppy drive. It may work
better with a true 360K drive, or a different controller (mine is
slightly non-standard, I think).

I also tried a regular single density disk, and it choked. I also
tried an enhanced density disk that was formatted on the other side (I
flipped it over), and it choked--I think the PC drive looks at the
timing hole to verify that the disk is in right, or something like
that.

Anyway, we may want to add AnaDisk to the FAQ and FTP site, as it's
currently the best bet for reading 1050 disks on a PC.

So what needs done now is for someone with different hardware to do
the same experiments I did, only with a good 1050 to verify things.
For simplicity, I've placed Anadisk up for FTP:
ftp://ftp.cs.dartmouth.edu/pub/crow/anad207.zip

If someone can get it to reliably read, Anadisk will dump an entire
disk to a file. We should then put together a short program that will
flip all the bits, and convert it to SIO2PC format (or one of the
other standards).

>it with a keyboard and no sound....

Wait- I remember a program for the Atari 800 that allowed you to siphon
the contents of cartridges off to disk. It required that you jam a pencil
in the catch for the opening cover, to fool the machine into thinking
the cover was closed. I forget the rest, but I also remember seeing
disks of things on cartridge, though of course, they may have been out
on disk also, and been only pirated copies. I'm pretty sure this worked.

7572. Lazer ?

>

Perusing the 8272A data sheet, and using their mnemonic IDs for
the data bytes, the significant fields seem to be the _N_ byte and
the _DTL_ byte DTL is Data Transfer Length). According to their tables:

N sector size
00 128
01 256
02 512
03 1024
04 2048
05 4096
06 8192

DTL is meaningless, according to the data sheet, _UNLESS_ N is 0.
Reading between the lines, this means to me that if N is zero,
then DTL establishes the sector length, at any value from 1 to
255. I would suggest you need to be certain you have 128
programmed in for the DTL value.

In addition to the information on DTL, though, it is apparent from
the tables of values for agps and such versus recording modes,
that there is no specific reference to a 128 byte sector in MFM
mode, only in FM mode. But this would mean you should be able to
do single densty in an 8272A, even if you can't do double at 128.

>Once you decide to actually pay the author and all the middlemen,
>however, the price goes up. Take out a few middlemen and a lot of
>packaging and you can afford to charge a price closer to the cost of
>copying.

Hmmm. Okay, so if I buy a disk I might pay, what, 50 cents for
it while the manufacturer might get it for one cent. That's a big
difference in % terms, but is it really going to deter piracy?
The big cost, other than the middlemen, is the book-sized
manuals that come with software. Most folks who copy a program either
don't need a manual (they already know how to use the program), or
they just pick one up off the shelf (ie, Que Books on WordPerfect).
Perhaps the manufacturers should forgo fancy packaging and books,
just sell a disk with a plain, typed label, then offer the books as
a separate purchase.
Perhaps they could cut out the middlemen by selling directly
to their customers. Call up and order. Visa/MC/Amex/Discover accepted.
:) It wouldn't even cost that much more in labor if they only sold
via modem. Call up, place your order electronically, the machine
checks the card number to make sure it is not stolen,etc., then
prints a packing slip and mailing label. Unless they invested in
machinery to automatically package the disks in a box and ship them
out, you'd need some labor to do that, however.
Then, perhaps they could sell WordPerfect 6.0 for $10 or so
per copy.
There's always advertising costs, tho.

>Other than lowering prices, the only alternative I see is somehow
>appealing to people's morality. Show them where the money is going
>and why they should pay. Threats of legal action don't work in a

That is what I meant by "education" in my previous message.
The anti-piracy mantra has always been that in pirating, you are
taking money away from the author of the program and the company that
distributes it. If they can't make a good return on their investment,
or can't make a living (in the case of the author), they'll take their
talents and capital to another industry with a higher rate of return.
The end result is no more software. So, in the end, you are hurting
yourself. In between the "no more software" scenario and a completely
pirate-free computer world, is where we are now: high prices for the
software, so that the minimum rate of return can be made so that the

company can hire programmers, update equipment, pay their bills, and provide a good return to their shareholders. When this becomes no longer possible (and I am not saying it definitely will), they'll "take their ball and go home", leaving us with our computers and no new software.

Which, of course, won't bother us 8-bitters. :) We already have so much software available we will never be able to buy it all. And, most of us are programmers to some degree, so if no one else will provide software for us, we'll make it ouselves. :)

It's those MS-DOS and Apple Mac people that I'm not so sure could survive such a happening. :)

-Joe

7578. Re: Atari 8-bit 2005

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-18 17:59:27 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Bux2PWn.lmcclure@delphi.com>
Source record: 96150

In a message dated 12-17-94, Joe Walsh said:

"To be blunt, will we still be using them in 2005? 2015?
Beyond?"

At some point, a point will be reached were it will become too difficult to find replacements for proprietary parts that fail. At that point, even the last die hards will have to surrender (or design replacements <grin>). Long before that, however, too many people will have left the market to sustain any reasonable amount of cohesion. As an example, try reaching out an finding another user of a Spectravideo SV-328, or Memotech MTX-512.

At some point, modern computer hardware will no doubt reach the point where the average user could write an effective Atari 8-bit emulator in compilied BASIC (!), which would leave little reason other than pure nostalgia or antique collecting to retain real 8-bit hardware. After all, if one could write the emulator in BASIC, and have it run full speed or faster, and handle 99% of the software, writing "add-on" modules for emulating current peripherals (MIO, Black Box, etc.) should be a snap, as well.

The key is again, when the last Pokey, ANTIC, or GTIA chip bites the silcon dust. By 2015, it may very well be possible to sit down at a current home system of that time, and design a FPGA that would exactly emulate these chips, be affordable, and perhaps even add a few goodies. If so, the Atari 8-bit could live forever, but the question is, by that time, would anyone care?

The Atari 8-bits have only been around for about 15 years. Looking farther than that into the future, my vision starts to blur a bit. <GRIN>

The good thing is, by that point we will have definitely
gotten our money's worth out of the equipment. :) Even if you were
using, say, a 1200XL purchaed brand new for $800, a couple of 1050's
bought for $350 each, and a 1025 purchased for $400, for a total of
$1900 (round it to an even 2000 with tax and perhaps a couple of
software programs) -- amortize that over the thirty year period
between 1983 and 2013, and you get a total of $100 per year, or less
than $2 per week.
Of course, most of us got most of our equipment for much less
than that.
On the other hand, if you have a $2000 486 system (like I do),
are you really going to be using that sucker for as long as you've
already been using your Atari system? Probably not. :) Figure a max.
of four years, if yousstretch it, for that machine. That's $500 per
year. :)

It will still be a sad turn of events when the last proprietary
Atari chip bites the dust, as you say. But, you never know...I mean,
there are still Model-T Fords running like new. :)

It takes more than CPU speed to allow emulators to work. Just because it has the brute force to do it in Basic doesn't mean you can do it. Just look at PCXformer 3 which by all raw estimates should be able to do it, IF the programming were perfected to emulate every graphical and sound nuance, which by all accounts it has not yet acheived.

Since noone seems to be releasing schematics for the custom chips into the public domain, there is no way to make your own custom programmable chip to copy it without reengineering the chips first.

Software emulation merely emulates HOW they work in a logical circumstance but does not mimick their exactly electronic operation. As I looked through STXformer for instance, I would see parts that said 'x bit polycounter' and what not. This is not as difficult as backwards engineering the circuitry of the chips, but even so, you have to be smart enough to know exactly how the chips work and figure out how to emulate this in software. Just because the archetecture is 15 years old and slow doesn't mean a child cn write an emulator for it. It still took a TEAM of talented engineers a good year or so to develop the archetecture. As primitive as some say it may be by 2015, it doesn't mean it is a snap to emulate.

> programmed in for the DTL value.
> --
> Richard Dell

Looks back at aging source code Yes, I had DTL set to 128. I also noticed that there was no listing for 128 bytes in MFM mode (which I believe the 1050 uses). BUT, even if it isn't even slightly Atari compatible, it should STILL be able to read and write the very format it created! And, on a one sector track, the gap length values can be safely set to the very maximum.

I fiddled with _every_ register, and it always worked with 1024, 512, or 256 byte sectors, but _never_once_ with 128 byte sectors. Hmmm... I'm going to go back and check the 8272 data sheets tomorrow, and see about writing a hardware-banging version. I also just grabbed anadisk from ftp, but haven't messed with it yet.

Best of luck!
Nate

BTW, that opens another topic, is there a reason why companies like Atari
who have shelved/dropped a computer line don't make the designs available?

After all, the 8 bit line is still surviving out here in the orphanage,
and if any of the custom chips decides to die, the system is a paperweight.

Someone could make a respectable amount of cash (maybe not a lot, but
enough to keep in the black), providing replacement chips to the userbase.

I would like to know the philosophy in keeping obsolete designs locked
away. Presumably Atari could make money licensing out the design to a chip
manufacturer. I understand they vetoed a request from a West German
manufacturer who asked for a license to produce 1050 / xf551 disk drives.

I think it's impressive to compare some XL games from 1984 with Doom for
the PC in 1994. In 1984 they don't need 14 megs to create hours of fun &
entertainment...
And Doom is based on Castle Wolfenstein (pc), which originaly cames from
the Atari XL, programmed 1984 or earlier...

LARGE 8-BIT LIBRARY FOR FREE! YOU PICK IT UP!

I have a large collection of Atari 8-bit and
Commodore 64 books and magazines which I wish to
give away to a good home. The catch is that you
have to take ALL OF IT, and you have to PICK IT UP
at my home near ATLANTA, GA.

Call me at (404) 447-4803 if you are interested
in setting up a time to come get these books and
magazines.

** I WILL NOT SHIP! THIS IS WAY TOO MUCH STUFF! **
Perhaps some kind-hearted soul in the Atlanta area
with a lot more free time than I have can
collect it and distribute it amongst members of the
Atari and Commodore communities!

The "library" includes:

Atari 8-bit related:
* 62 unique ANTIC magazines (plus about 10 duplicates)
from the years 1983 - 1989
* 5 ANALOG magazines, 1985 - 1988
* Softcover books: Master Memory Map, Your Atari Computer (x2),
Atari BASIC (x2), Games for Your Atari Computer, Atari Games & Recreations,
Atari Sound and Graphics, Computers for Kids, Kids and the Atari,
Games Ataris Play

Commodore 64 related:
* 62 issues of Compute's Gazette, 1983 - 1989
* 24 unique RUN magazines (issue #3 through #28, missing 18 and 19)
* 12 unique Ahoy! magazines 1984 - 1988
* Softcover books: Mapping the C64, Compute's ML Routines for the C64,
C64 Favrotite Programs Explained

Most of this stuff is stored in cardboard boxes that copier paper comes in.
As an example, all of the 72 Antic magazines fit in one of these boxes.
In addition to the above, you must also take one (1) additional box of
PC-related magazines (PC Computer, PC World, etc). All of this stuff
takes up 4 boxes (estimate -- I haven't packed it up yet).

Again, call (404) 447-4803 if you want to pick pick up all of this
stuff, FOR FREE!!!!

Vince Grienti <ai542@FreeNet.Carleton.CA> writes:

>BTW, that opens another topic, is there a reason why companies like Atari
>who have shelved/dropped a computer line don't make the designs available?

Actually, John C. Dvorak just wrote about that in a recent
column in PC Computing. He was speaking in reference to software
source code in the Ms-DOS world, of course, but his argument applies
here as well.
He felt that any software that is no longer being distributed
should be have its souce code released into the public domain. He felt
that this would generate a lot of good will toward the companies doing
such things, at no cost to them. As he said, why let good designs
rot away in file cabinets?
I do agree. And that applies to shareware authors, too. I
can't tell you how many times I have downloaded a programming utility
or other program, found it useful but in need of improvement, only to
find that it was developed years ago and the author has moved/changed
E-mail addresses, etc. and left no forwarding instructions. If he or
she would have just made the source public domain once he or she
stopped supporting his or her product, then there would be no problem.
As it stands, a useful tool is locked in stasis as released, never
able to be changed to suit the changing needs of its users.
Similarly, the Atari community's former members should have
this policy. While some have agreed to sell off their source to
those willing to make a profit from the sale and improvement of the
code, the instances of this are all too few. If we had the source to
the great programs of the 8-bit era, we could build from them. Instead,
we must start from scratch. And, again, those programs are locked in
the state they were released in, which is all too often a buggy one.
Finaly, to get back to hardware, having the design notes and
schematics of all the custom chips in the Atari, as well as the right
to reproduce them (and the peripherals), we would be in a much better
position, vis a vis the perpetuation of our hobby.
With so little incentive for new designs of software and
hardware for our favorite computers, it would be great to be able to
build on what has already been developed.
Our only hope is that this information IS still locked in some
file cabinet (or off-site storage facility). In many cases, it may
have been destroyed. Who wants to pay for the storage of information
of no commercial significance?

[sigh]

-Joe

7591. What kinda power supply needed for an Atari 400?

7592. Advice on games

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-19 02:41:42 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELTPCIUUUp@stingray.manawatu.gen.nz>
Source record: 96069

OK. Well I have Fort Apocalypse on tape and would like to get hold of the disk version.

As there are no Atari dealers in NZ and I'm sure that this game is no longer being produced, is it legal to make a copy of the disk version? I don't really want to have to send overseas to buy it as I am sick of losing money this way, by companies failing to send me the product and just cashing my cheque.

I'm not sure how things stand as if no-one is making the game and therefore can't sell it to me, is it still illegal to copy it?

I have only recently come back to my 8-bit and had been able to convert most of my tape-based games to disk, but now I just can't remember everything I used to know about converting to disk.

Plus I remember something about an unusual loading routine that F.A. used. Instead of relearning all that stuff, I was hoping to just get a disk-based copy instead. But only if it's legal ofcourse.

Can anyone advise me? Or perhaps tell me what the (perhaps not stictly legal, but "accepted") standard for this newsgroup is? I don't want to do anyone out of any royalties... but would I be now?

I'd appreciate any light you can shed on this subject,

Richard =8-]

PS. I have seen loads of BoulderDash "clones" on various other computers, but the best is still (by far) the 8-bit Atari version - don't you agree?

Have you tried it on more than one machine? Once people have the syntax figured out, it seems like any remaining problems are associated with the drive in the PC.

I can say I've used UTIL quite a bit on several different PCs, and I've never had a file corrupted.

> Now, M. Current says R. Cortese, I think, uploaded a updated 'util'
>to 8bit/Diskutils/dskutil.arc, which I downloaded and it looked the
>same as the one I had. I didn't see a new 'dskutil.arc' in the new
>uploads list from J. Lenn.

I have to apologize, I gave the wrong filename.

***** The latest and "greatest" version of UTIL is called MyUTIL. It was worked on by Mark Vallevand. The Merit/UMich filename is Diskutils/myutil.zip.

Since I've never seen UTIL corrupt stuff, I can't say whether using MyUTIL would help you, but the syntax of MyUTIL is definitely much cleaned-up over UTIL.

>a Atari 1200 with dual disk drive. Atari discontinued this after
>manufacturing a few thousand of this. It newer actually sold it publicly.

The 1450 is really better thought of as an upper level 800xl. The OS is byte for byte the same as what's found in the 800xl and unlike the 1200xl, the 1450 supports a PBI. Sadly, neither the BlackBox nor the MIO will work when hooked up to the 1450's PBI due to what looks like a conflict with the way each of the devices (T: and V: on the 1450 and the MIO or BB) try to use (map) the D6XX area. It almost looks like ICD tried to avoid this type of conflict but ended up using most of the D6xx area as options were added to the MIO.

>I'm looking for any and all unusual Atari 8-bit machines and peripherals
>like the 1450XLD, the Atari expansion chassis and other similar items.
>Email me offer.

There's a person who's posted that they have a 1090 exp. box, however, I'd bet the asking price will be a bit steep. As far as the 1450xld's go, of the several folks I know that have them, none will part with 'em.

: supports a PBI. Sadly, neither the BlackBox nor the MIO will work when hooked
: up to the 1450's PBI due to what looks like a conflict with the way each of
: the devices (T: and V: on the 1450 and the MIO or BB) try to use (map) the
: D6XX area. It almost looks like ICD tried to avoid this type of conflict but
: ended up using most of the D6xx area as options were added to the MIO.

I asked Bob Puff to try to explain why it was that the PBI on my 1400XL
was incompatible with the BB. He said it was too technical to explain
but that it was unresolvable. He did, I think, tell me that T: and V:
were considered PBI devices...

The thing is, I thought Bob Woolley got one of his 1450s to work with a
Black Box so I was a little jealous, thinking that perhaps mine was a
poorer flawed motherboard revision.

7597. Destroying the Dark Tower

(Erik, I apologize.)
So, now, I never got to the Dark Tower, so, I made it so I got a new
man every time I got blowed up. I'm taling about 'Stealth' or
'Landscape'. Change dec $e5 to inc $e5 ($c6 $e5 to $e6 $e5) and you
get a new man every time you get blowed up. Do THAT with 'cybermorph'
or the zillion other games where you run out of men, airplanes, boats,
tanks or whatever and never see the end of the game.

: FTe is sponsoring a 65816 programming contest to promote the
: new Sweet 16 board. One of the grand prizes will include an
: Atari 1400XL, assuming that a minimum # of entries are recieved...
:
: Details will be posted VERY soon. The Sweet 16 boards are NOW
: available, and will be shipping starting Dec. 26th.

I think I forgot the details. Sweet 16 does or doesn't have 24-bit
address RAM slots?

Perhaps I am confusing this with MARS16.

For the price you are selling it at compared to MARS8 it sounds like it
must be just an adapter board to allow the 65816 in '802 mode in which
case the only real improvements would be the new 16-bit registers and the
relocatable page zero.

Vince Grienti (ai542@FreeNet.Carleton.CA) wrote:
: BTW, that opens another topic, is there a reason why companies like Atari
: who have shelved/dropped a computer line don't make the designs available?

There is no logic in any of what Tramiel-Atari does. People have gone to them before asking for things to be released to the public domain, most notably the XL/XE OS, of which there does exist several close but still possibly imperfect disassemblies. Atari balks at the idea. So don't expect them to give up the schematics to the custom chips either.

They are looking at this from a legal standpoint. Just as local government often relies on speeding tickets as additional revenue, Atari is hoping that someone, even out of desperation, will cross a line and they can swoop down like vultures onto the remaining disenfranchised Atari 8-bit community and slap a lawsuit on them.

This almost happened with at least one Atari 8-bit developer in the last 4 years, and he had to quickly LICENSE the usage of the XL/XE OS code.

Someone else of note in the Atari community who shall remain nameless supposedly got in hot water about trying to make an XE on a PC card.

Now mind you, most of these incidents occured on the last legs of the 8bit with Atari or soon after Atari gave the official word of discontinuing support.

There really was little gained by these strongarm tactics and all they do is further estrange the once-faithful original Atari userbase.

I do not think that the custom chip schematics were destroyed. In fact, what I said in jest about Jay Miner may be true. There is no reason that those who worked on the 400/800 might not have personal copies of the schematics in their archives. I believe Doug Neubauer worked with Jay Miner. Why don't we try to track him down? He would be a great guy to talk to in more ways than one. Back to Atari. We must remember that Atari DID to a "little" bit of R&D when they designed the XEGS. They changed the OS and they changed the way RAM was layed out. I'm sure that schematics were available as late as 1986/87. Since this was well into the Tramiel era, I don't see why Atari would have disposed of them. However, I wouldn't put it PAST them since supposedly much of the WARNER era Atari was lost during the changing of the guard.

Hummm... this made me think of an interesting idea.

How much do you suppose Atari would want for the rights to the 8-bit computer? All the schematics, chip designs, prototype info, etc....

Could current 8-bitters collect enough money (collectively) to make it all public domain? Maybe a nice downloadable set of scanned blueprints and documents?

: I think it's impressive to compare some XL games from 1984 with Doom for
: the PC in 1994. In 1984 they don't need 14 megs to create hours of fun &
: entertainment...
: And Doom is based on Castle Wolfenstein (pc), which originaly cames from
: the Atari XL, programmed 1984 or earlier...

In name only, not even that. "Castle Wolfenstein" came out for
the Apple II in 1981. "Wolfenstein 3D" came out in early 1992.
The games have little in common.

See, many of the Id people were programmers for Softdisk, an
Apple II disk magazine.. which is still published. I'm sure
one of their favorite games was CW.

I think that updated version has been uploaded quite a while ago.
Check out the filesize of the newer UTIL.EXE.
As far as I recall it should be 16613.

I didn't have trouble with this version on 360K drives. HD drives won't work
always correctly, though.

7608. 8-Bits In 2005

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-19 08:16:15 UTC
From: b.poehland@genie.geis.com
Message-ID: <199412190816.AA128934970@relay2.geis.com>
Source record: 96075

I've been using an 800XL for going on 11 years now. In various closets in my house there lie 6 or 7 286's, 386's, & a 486. (No Pentiums yet, I'm waiting for Intel to fix the defect first!)

So here in the Pentium Age I'm still using a "decrepit" 6502 Atari. Why? Because my needs haven't changed much since the day I first bought this old thing, & such upgrades as I needed to make it more productive were furnished in the marketplace. I won't leave this platform until I find something else at least as good, if not better, at a price I feel is reasonable. So far my forays into the IBM world have not justified abandoning the 8-bit platform. I often compare the 8-bit to a worn pair of comfortable old shoes that I simply can't bear to throw out no matter how badly out of style they've become. I'm hopelessly addicted to AtariWriter, BobTerm & SpartaDOS. The hardware & software still continues to serve my needs. You don't need a 66MHz 486 to do wordprocessing. 95% of the time people spend wordprocessing is in the forming of your thoughts; the human user is the bottleneck there so a faster machine buys you nothing.

But... physically, how long can these machines last? I think they could last a lifetime. The oldest & most used of my nine 800XLs is still going strong with most of its original parts. In 11 years I had one DRAM failure & my Delay Chip fried on me last year. All the other semiconductors are just fine. The original keyboard is still in service tho showing much wear. I pound the hell outta my keyboards, I have a heavy touch. The pebbled surface on all the keys is completely worn off & some of the keys are becoming deformed as the plastic wears away unevenly. The RETURN key especially. I keep wondering how long it will be before the keyboard fails. No matter, I'm well stocked on spare keyboards, I can beat up my computers for another 30 years at this rate.

The Nomex plastic cases in which the XL computers & the 1050 drives are installed will eventually disintegrate but should be good for at least 50 years provided they are not exposed to either direct sunlight or fluorescent lights. The ultraviolet component of those two light sources will accelerate free-radical degradation of the plastic polymer in the presence of oxygen. Air, light, & heat will in any event degrade the plasticizers in the Nomex itself, causing it to become brittle & eventually crumble to dust.

I don't know what the lifetime of the 40-pin LSI chips is, I have yet to personally experience one to fail. The GTIA, ANTIC, POKEY, CPU & PIA in all my machines are still going strong despite, uh, some occasional abuses. My feeling is that the electronics will outlast the case hardware. Even so I keep several complete sets of spares on hand.

Disk drives & monitors always die first. The belts in the drives dry rot. Because of greater thermal stress in disk drive electronics, electronic

failures, especially in the power supplies, will become more frequent with age in both the 1050's & XF551's. As long as parts remain available, however, drives can always be repaired. I got enough spare parts on hand to keep my 1050's, 551's, hard drives & 3.5" floppies going for at least 20 years.

The average life for a monitor is probably a little less than 10 years. Tube filaments burn out by then. The horizontal drive components in all monitors take a tremendous beating & are the first components to fail. Power supplies in monitors also are greatly stressed & will typically fail in 6-8 years. And composite monitors are not to be found any more. No matter, when your monitor dies you just add the Woolley TTL upgrade, stick an IBM MDA monitor onto your system, & continue as usual for another 10 years.

The real problem is software. Cartridges will last forever, but software on magnetic media will succumb to "disk rot" within 8-15 years. Especially at risk will be commercial software that was originally released as a heavily protected boot disk. The commercial companies are long since gone so you can't buy a replacement copy when your original disk finally fails. Such an event is truly evil when the program is a database (!). Unless all the software can be made available in an archive somewhere, the gradual deterioration of disk- & tape-based software may just be the weak link that drives users away from the machines long before the hardware has actually worn out.

- Ben Poehland

7609. MASSIVE AUCTION VI -- update #3

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-19 08:28:09 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3d3g6p$gb7@usenet.INS.CWRU.Edu>
Source record: 96076

```
THIRD UPDATE:
-------------
MASSIVE AUCTION VI -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!
------------------------------------------------------------------------

This is a rather large file (just under 34,000 bytes), so if you don't like
large files, and/or auctions, PLEASE stop reading now. You have been warned!

------------------------------------------------------------------------
Games and/or game systems included in this auction are:

ATARI 2600 games and systems ATARI 5200 games and systems
ATARI 7800 games ATARI LYNX games
ATARI 8-bit games and systems COLECOVISION games and systems
COLECO ADAM system COLECO 2600 ADAPTER with 2600 games
COMMODORE 64 system INTELLIVISION games and systems
INTELLIVOICE systems ODYSSEY2 games and systems
PONG (BENTLEY) systems SEGA MASTER SYSTEM games and systems
TOMY TUTOR game TEXAS INSTRUMENTS 8-bit systems

------------------------------------------------------------------------
NOTE: My want list is almost ready. If interested, please request it.
If you have a trade list and/or want list, please send it. -- MJN
------------------------------------------------------------------------

I will post updates approximately every 24 to 30 hours, and then delete the
last update after I'm sure the new one is accessible. I will also e-mail
the list to all bidders, and anyone who requests to be placed on the auction
e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

************************************

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

************************************

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, DECEMBER 23RD.

2) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.
-- YES, THIS USED TO BE RULE #9. I'M NOT KIDDING!
```

3) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO
PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #2)

4) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

5) BUYER PAYS ALL SHIPPING COSTS.

6) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

7) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN
PRIORITY (UNLESS THE TRADE OFFER OVERWHELMS ME). I COLLECT FOR OVER
45 DIFFERENT SYSTEMS, PLEASE FEEL FREE TO SEND ME A TRADE LIST.

8) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

9) IN CASE OF TIES, FIRST BID RECEIVED WINS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER,
DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A
CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY
WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH (MY BANK IS VERY
PICKY, BUT THE U.S. POST OFFICE WILL CASH A CANADIAN POSTAL M.O.)

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a STRONG preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, ONE ATARI VIDEO TOUCH PAD CONTROLLER, AND TWELVE (12) CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

7610. XEGS Keyboard Wanted.

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-19 08:47:19 UTC
From: naina@technet.sg
Message-ID: <3d3han$cv5@raffles.technet.sg>
Source record: 96086

I just bought a brand new boxed Atari XEGS the other day for US$30. Now I'm looking for XEGS keyboard. Please email me all offers, or at least let me know where I can buy one. Thanks.

naina@technet.sg

7611. Re: Transferring Atari disks to PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-19 09:22:04 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <129667@cup.portal.com>
Source record: 96094

ARRRRGGHHH! It finally hit me! The inter record gaps are set by the
INT 13 bios call! It's set for the proper gap lengths for 9 or 10
gaps on a 512 byte/sector disk, you can get away with it on an
256 byte/sector 18 sector disk, but when you try to put 26 gaps
on a disk there isn't enough room left for the sectors! That's
probably why all your other stuff like 1024 byte sectors worked!
If that's the problem, I think you can use INT 1eh or something
like that to point the bios to your own device control block
with a different inter record gap. I'm over my head when it
gets to this level on a clone.
Rick

What on earth has MS-DOS got to do with GEM on PC dying??
GEM on PC naturally ran on top of MS-DOS also!!
Ventura Publisher was a very good DTP program on the PC that ran under GEM..

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

Is currently holding Monthly Swap Meets with an occasional Raffle. Monthly Swap Meets are Held on the First Monday of each Month from 7 PM - 10 PM. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

FREE ADMISSIONFREE ADMISSION**FREE ADMISSION**FREE ADMISSION**

PLENTY OF FREE PARKINGEVERYONE WELCOME**PLENTY OF FREE PARKING**

FOR ANY INFO INCLUDING TABLES: CALL BEN AT (503)256-9974!!
THESE SWAP MEET SPONSORED BY ACE OF AMERICA!!

This Message is distributed throughout the Pacific NorthWest, everyone reading and their Brother is welcome to come and Attend!!

Next Swap Meet will Be January 2nd, 1995 at 7 P.M. See ya There!

(About the possibility of 'util' and corruption of files.)
I would just say that if there is no problem with corruption, then
there is no reason to verify files as you transfer them using 'util'.
It remindes me of the Timex 2068 and doing 'verifies' with each tape
save. The 2068 would fairly often botch up a save and if you didn't
get a good save before you turned the computer off, you lost your work.
I would submit to M. Current and J. Lenn that they don't really know if
there is a problem with a 'util' transfer unless they verify it. If no
problems are showing up then they are correct in their confidence.
However, a bunch of corrupted files are showing up on archives and
bbses and I wonder how much of it has to do with 'util'. My XT and
floppy are pretty good, I have a good floppy controller and my 1.2 meg
5.25" floppy is less than a year old. I have now a new crc16 for the
8-bit that agrees with the crc16 values in ARC and other crc16 programs
for the ibm. If anybody is interested I'll arc up the version 2 crc16
and the ibm crclist.exe crc checker and upload them to the archive. Tom
Hunt, of course, is doing one better, he has a crc32.com.

Speaking of monitors. Eventually NTSC will be supplanted by an HDTV standard. HOWEVER! It would be suicide to release an HDTV television which can not support NTSC in some form of emulation, letterboxed, whatever.

So as long as you can get HDTV sets with composite or split video inputs, you will have a monitor for your Atari.

Of course, if HDTV uses some form of digital cable, then composite and split video might not be supported but if it supports NTSC fallbacks it will probably support some NTSC inputs for those with old VCRs and laserdisks.

Personally I dislike standard television technolgy. I mean, it's what, 40 year old tech? The flyback transformers hiss annoyingly after a while, and the blacks aren't as black as VGA style monitors. Not to mention the roundedness of the tube in most cases and the overall bulk.

The sooner they come out with a nice wallmountable 2" thick flatscreen HDTV screen ala Total Recall, the better. Not necessarily LCD. I think LCD is too slow to look really good. They are working on new technology for flatscreen TVs using some other material.

>was incompatible with the BB. He said it was too technical to explain
>but that it was unresolvable. He did, I think, tell me that T: and V:
>were considered PBI devices...

One of the first things I did apon getting my hands on a 1450 was to dump the 4k handler rom to disk and run it through a disassembler to see what was going on. The first thing I found was the V: handler of the 1450 used the same address space as the R: handler on the MIO... In other words, the MIO believes that the R: device is being called from the time you power up the computer. What seems to happen is the MIO is blocked from reading the conf. info from track 0, as well as being blocked from writing to the disk at all. Both T: and V: map to both D1xx and D6xx but only seem to hold the D6xx area... Oddly, you can run the setup menu on the MIO, you just can't save your information to the disk, nor can you always use the V: device when the MIO is hooked up. A quick look through the blueprints for the 1400xl seem to confirm this as well.

From what I've been able to get from people at Atari and ICD, it seems what Atari wanted to do was reserve fixed chuncks of the D6xx area for each device as it was mapped in. V: and T: come as device 8 and 2 so no other third party could use either that device number or the aso. device area in the D6xx block.

As far as being flawed, I tend not to think so...neithr ICD nor Bob Puff had to follow the Atari design spec for a pbi device...so it's no wonder that neither device works...Still, I'd love to know what Bob W. did to get his 1450xld to work with the BB.

You do have a point, in that I've used it mostly for downloading stuff
(including binaries). Maybe it's completely reliable for MS-DOS -> Atari
transfers, but not so reliable for Atari -> MS-DOS transfers?

Sounds like you have the same situation as me, only your PC's drive is
able to read single density. Were you using a 360K or 1.2M drive?
Would anyone else like to play around with Anadisk and figure out
exactly what it takes to get it to work?

Source record: 96022

The recent posts on the XF551 have gotten me to thinking about a non-Atari application. What are the physical dimensions of the XF551? Am I correct (never having seen one) that it is a 5 1/4 inch drive that is easily converted to 3.5 inch, that it does true double density (360K), and if converted to 3.5 720K, but does not do what PC types call HD (1.2 meg or 1.44 meg)? Finally, what is the going price range on the used market (I know they are available new from B&C or someone)?

Sorry if this is a bit technical.

Actually, my original program did use the disk parameter table (at int 1E). It set the inter record and first gap to the maximum values allowed (and several others while I was testing). Since I only wrote one sector, this shouldn't have been a problem. Anyway, I've given up on using the BIOS to do this kind of reading, and will stick to banging the 8272 directly.

A person wrote me to say that 128 byte sectors in MFM really weren't supported by the 8272. Some NEC u765 clones _can_ handle this however. 128 byte sectors are only supported in FM mode (single-density). Since the BIOS uses exclusively MFM mode, and will not allow you to use anything else, this explains why 128 byte sectors aren't properly handled.

If what he wrote is true, _someone_ must have a controller that supports 128 byte MFM sectors. So, if anyone discovers that Anadisk can successfully read high-density disks _all_ of the time, I would love to buy one! :-) I'm getting all the information I can gather on the 8272, so you should soon see a stand alone program to read single-density disks directly into a file.

If anyone is able to successfully (or semi-successfully) get a dump of a high-density disk, uuencode it and send it to:
SLTW2@cc.usu.edu
I will patch Deana to convert high-density disks as well.

Best of luck!
Nate (Nathan.Monson@lambada.oit.unc.edu for chat,
SLTW2@cc.usu.edu for large mails.)

I'm using a really old (1986) 286 motherboard, with a really high-end (for its time ;-) RLL hard disk/floppy disk controller with some cache and its own BIOS and lots of wierd features I haven't been able to figure out. My drive is 1.2M and about 1 year old.

I tried Anadisk on a friend's 386, and he can read enhanced-density disks with a little success, but no more than me. At first, we couldn't get it to work at all, but once we removed his PM memory manager (QEMM), it worked much better. So everybody remember to boot clean (no memory managers) when playing with Anadisk.

When playing with enhanced-density disks, I noticed that once in a while Anadisk will retrieve the entire sector, and reads a different amount of data each time. If I can discover how Anadisk does it, I will write a program that keeps trying until it gets it right (assuming this is possible).

Best of luck!
Nate (Nathan.Monson@lambada.oit.unc.edu for chat,

Um, Microsoft already had the DOS market, so it was easy for them to
also get everyone to use Windows -- just package it with DOS (usually
already on the hard disk).
I'm not saying that's what made Windows beat GEM, just that that might
have had something to do with it.

Yeah -- Doom bores me pretty quickly, and although it has great graphics,
I was disappointed to see that the Jaguar version didn't have better
graphics than the PC version.
The thing is, so many people want to play Doom and similar games these
days, so they get a PC and maybe one of those expensive adapters.

My favorite game is still Joust, and I haven't seen a decent PC version
yet. :-) Too bad I had to switch my Atari to a 9" mono monitor (the
one for the Apple IIc) to make room for my new printer.

Doom bored me pretty quickly as well.
When Wolfenstein 3D first came out, it was pretty exciting,
mainly due to the interface rather than the game itself.
Now that we have Doom, Wolf3D, Alien Vs. Predator, etc. etc.
ad nauseum, I'm sick and tired of the genre.
I guess it is no different than what happened at every other
breakthrough point in the games industry-- space invaders, Pac Man,
Karateka (or whatever started that genre), Super Mario Bros., and
many more games created genres that were quickly imitated to death.
Unfortunately, Nintendo still hasn't learned and continues to release
Super Mario Bros with better graphics and sound each year (culminating,
so far, with Donkey Kong Country).
There are a few truly *different* games out there, and they
stand out as beacons in an industry otherwise filled with "me too"
products. Games like M.U.L.E., Ballblazer, and Joust are examples of
this. Other outstanding products are the pinnacles of their genre.
Examples include Star Raiders, Zork, and Ultima III.
The difficulty arises in distinguishing the pinnacle products
from their lesser bretheren.
Fortunately, the sheer volume of software for our Atari 8-bits
allows for a great number of worthy games. And, we have the pleasure
of playing games that our cousins in the MS-DOS,Amiga, and ST worlds
may never be able to play, such as Omitrend's Universe, Bug Hunt,
and Rescue on Fractalus.
On top of all that, we have some of the finest arcade translations
ever created. Games like Pole Position, Robotron: 2084, and Mr. Do!
come to mind. While they may have appeared on other computer platforms,
the Atari 8-bit renditions are the best and closes to the arcade
experience.
In short, they can keep their Doom, their Wolf3D, and their
Sim{insert noun here}, because we already have it all. They're just
trying to catch up to us.
Call it the Atari Envy theory of computer games. :)
(Apologies to Freud.[grin])

-Joe

I am looking for a copy of M.U.L.E. for the Atari 8-bit. If anybody wants to sell their copy, I will happily pay more than its worth for it. (Or if anybody knows of anyplace that has it, please point me in the direction).

Also as an aside, anybody have a working 410 cassette drive they want to sell? Thanks for any info/leads!

Yes, in fact in my opinion the Atari 8bit version is exceedingly poor because it uses artifacted Gr.8 and blits everything rather than using something like Gr.15 and hardware sprites. This technique was common with Apple ports. As a result the animation on the characters is some of the WORST of any commercial game released for the Atari8. The digitized voices are also absolutely impossible to comprehend.

The original Castle Wolfenstein has its fans, but I am not one of them. Out of principle I can not enjoy a game that was created with such disregard for the Atari8's hardware. Other games worked okay as far as porting from the Apple like Pinball Construction Set. It doesn't have to blit as much so it can keep it smooth. But with Wolf it was clear that there was a lot of room for improvement.

Where is the 4K handler ROM located??

All I could determine was that if I removed the SC-01 chip that both V:
and T: were gone from the handler list.

So I assumed that the chip handled the speech and ALSO had the handler
information. I located the OS and Basic ROM and found no other evidence
of a mystery handler ROM. When I replaced the OS with a MUX ROM, the
handlers still loaded in, so they are not internal to he OS. The 1400
series uses, as far as I can tell, a 100% stock XL/E OS.

The SC-01 chip appears in my machine as an EPROM with a sticker over it.
It's funny because I don't associate a hardware speech synthesizer with
an EPROM--an EPROM to me means code, and that would suggest that the
synth is nothing but software!

That's a news flash. The only REAL reason I stopped using my 1400XL is
that I got depressed over the fact that I was probably never going to be
able to use it as an all-in-one perfect machine.

Just imagine this, 1400XL w/MIOII and Sweet16 board installed, and 320K
upgrade. Yum. There is no other 8-bit that would compare to that. V:
handler, 65816, banked RAM, Basic rev. C, and a 1200XL style keyboard.

That is, if the MIOII REALLY works. Bob seemed to suggest that my PBI
was different from other 1400s.

They don't advertise everywhere in the US. I'm not sure I've seen a TV
ad for Atari in my life, and I know I haven't seen any ads for the Jaguar.
When I turn on my TV, I see a few Nintendo ads, the occasional 3D0 ad, and
zillions and zillions of Sega ads.

7640. Re: 'Util' and file corruption

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-20 06:41:31 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Dec20.013424.6083@wariat.UUCP>
Source record: 96008

(M. Current asks which direction I had problems with 'util' and
corruption of a few files. And others made comments, etc.)
I'm talking strictly about util writes. I just did about 3 dozen test
transfers. Other than one weird transfer, all worked correctly. I
suspect my problems come up when I format the disk on my Indus. When I
use the util /i a: command, the disk reads and writes faster on both my
ibm and my Atari. The strange results I got one time was with my Indus
formated using MyDOS 4.50.
I don't want to bore any more. Just be aware that I really did catch
'util' red handed once. And if you really want to make sure a 'util'
transfer worked, it doesn't take too long to verify it with a crc
check.
I guess I didn't use the correct command line somebody pointed out.
That's the command line that worked and I still use it. I don't think
using an incorrect command line will effect the reliability of a
transfer if the command line works, other than the /b switch.
I didn't read the docs, don't think my version came with any. Just
typed 'util' and went by the built in help. My version is not the one
mentioned by M. Tomszak, mine is 16384 bytes long. And I am using a
High Density 1.2 meg floppy.

7641. getting files from PC to stock 1050

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-20 13:36:27 UTC
From: dch@dcs.ed.ac.uk
Message-ID: <D1434s.356@dcs.ed.ac.uk>
Source record: 96024

Ugh, ok, here's how I did it (from memory)-this is a tortuous route, there's probably a simpler way.

You need:-
SIO2PC - from the archive(see the faq) {get it anyway it's a must}
DOS2.5 with diskfix utility - which you've got hopefully

This is to a stock 1050 attached to an 800XL.

Use the program makadisk.exe (given with SIO2PC) to create a 90k disk with your program on.

Run SIO2PC and load in your program from the disk
(there's something wrong at this point and a straight
copy using DOS to the 1050 always fails to work for me, SO,,,,)

Run the diskfix program (on the DOS2.5 disk)

Rename your program

Copy across to disk in 1050

I think that was the procedure, hopefully I'll get time over the Christmas break to play with the Atari again and refresh my memory .
If you can't manage using the above list mail me in the New Year and I will probably be able to fill in the missing details.

If anyone knows a simpler way - from PC to a stock 1050 (i.e. not true DD drive) post it up to the net, let us know.

Rick Cortese had a simple circuit and program to do a null modem using the joystick ports a long while back, if I recall correctly.

Any advance on the above two ?

7642. Bi-weekly Atari 8-bit support posting

```
ATARI 8-BIT SUPPORT FROM RICHARD GORE
-------------------------------------

ARENA XL/XE 64K Disk only PRICE: #5 ($10)
----- The full 50 level version of the excellent puzzle game that
was a demo bonus on Page 6's issue 66 disk. You must guide
a set number of balls to the exit by strategically positioning pieces
of wall. Good graphics and very addictive.

BUBBLE ZONE XL/XE 64K Disk only PRICE: #5 ($10)
----------- A fast blast em set on a grid being invaded by expanding
bubbles. Collect the tokens and see how far you can
advance. Original gameplay and top notch grpahics make
this a game of high quality.

JAWBREAKER 16K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
---------- Classic maze game based on Pac-Man, munch the sweets but
don't forget that important dental hygiene! Two
different mazes are supplied which were originally sold as separate
games. Double the value.

MOUSEKATTACK 48K Disk, Tape, Rambit Turbo tape PRICE: #4 ($8)
------------ Another classic maze game, but this one involves you
plumbing the levels of Rat Alley. Addictive arcade
action with a simultaneous two player mode.

MAZE GAMES OFFER: Buy both Jawbreaker and Mousekattack in one pack
for the bargain price of #6.95 ($14)!!!!

GTRACKER XL/XE 64K Disk only PRICE: #6.50 ($14)
-------- A new sequencer program for Replay (or Parrot) compatible
digitised sound samples. You can construct your own digi-
tunes using your own samples. Supplied with several sample tunes, a
player program, 4 page manual and a free PD demo disk showing just
what can be achieved. Now also supports stereo playback of your tunes
on a suitable upgraded machine. We will also be releasing extra tune
data disks in the future.

SUPER PRINT LAB XE XL/XE 128K Disk only PRICE: #6.95 ($15)
------------------ A new monochrome design and print program
developed for 128k (130XE type memory) users.
Features include the usual arrary of drawing tools as well as programs
to create icons, split a screen, mix 2 screens and a mini database for
creating labels. Printer support is included for Atari 1029, Epson
compatibles and the Atari 1020 in upto 4 colours!! Yorky compatible.
```

YORKY 256K MEMORY UPGRADE

A 256k memory upgrade that simply plugs into the PBI port of your
800XL (or internal 64k 600XL). NO soldering is required. Supplied
ready to plug in and use with all the necessary RAM chips, the manual
and a disk of support software.
VERY FEW UNITS LEFT. THIS COULD BE YOUR LAST CHANCE TO OBTAIN ONE.

PRICE: #50 +p&p (UK #2, EC #3.50, WORLD #5) or $90 complete.

I also have limited stocks of the following commercial software items.
The software items below are brand new, in their original packaging,
with English manual(s) and most are still shrink wrapped.

Halley Patrol (disk) #4.00 ($9)
Summer Games (disk) #5.25 ($11)
Cyborg Warrior (disk) #5.25 ($11)
Dropzone (disk) #5.25 ($11)
Solar Star (disk) #5.25 ($11) also known as Sun Star!

Gato (rom) #6.95 ($15)
Desert Falcon (rom) #6.95 ($15)

All software prices include postage and packing to UK addresses,
overseas please add #2 per order. Prices in US$ include shipping but
payment must be made in US$ cash (notes only please - no coins).
UK pounds are accepted in cash, cheque (made payable to Richard Gore),
IMO or postal order. Contact address:-

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW,
ENGLAND

Telephone: (01302) 784642 after 7pm (GMT) weekdays
any reasonable time at the weekends

E-mail: chmrig@leeds.ac.uk

Coming soon..... new software from Germany, Golf Tour 94 (maybe 95!)
and more. Updates will be posted to the Digest.

I think the idea was the same. They just freshed up the graphics (if you call the original screen-layouts graphics...). But I spend a lot more time to place the bomb in the bunker (Beyond Castle Wolfenstein) than running through full-colored tunnels full of super-duper monsters and mega-blasting weapons. All you need is a bulletproof vest, a grenade, Sauerkraut & Liebfraunmilch...

> See, many of the Id people were programmers for Softdisk, an

Maybe. But It seems to me that a lot of brand new games today are just recycled ideas from yesterday. Maybe we will receive PACMAN-3d one day, based on the Doom graphics routines from Id... :-)

Atari 8-Bit 2005

Maybe I'm just kindov sensitive or something, but somehow whenever I see someone mention "Model T Ford" with reference to a Classic-8 it gets my hackles up. Dadburnit, 11 years ago I invested seriously in my 800XL system & over the years have upgraded it to a level of performance that compares favorably to an IBM AT-class machine & even does a few thing no AT can do.

I still use my 800XL for all the same purposes for which I originally purchased it. I seldom play video games & would be considered a serious "power user". I ran Atari Classics Magazine entirely on this computer for the better part of 2 years. Anybody who knows anything about the publishing business would be amazed such a thing was possible. I composed dozens of magazine articles on it for which I earned substantial sums of money (enough to help make the down payment on my house). I took $800 in tax writeoffs for the 800XL system I used in my office at work for 5 years. I composed at least 5 manuscripts for scientific journals on it. I used SpartaDOS as a springboard for learning IBM "Messy-DOS" (the environments are similar). I routinely read/write/format MS-DOS diskettes when exchanging ASCII data with the "outside" world, so seamlessly people don't believe I'm using such an ancient computer. I've written several thousand letters on it & received nmerous compliments for the appearance of my correspondence (a 24-pin printer helps). I flabbergasted the industrial tekkies with a hardwire connection of my 800XL to a mainframe VAX system (they only found out about it when a lightning strike locked up my port & they sent someone to repair the port). I just completed my mother's will using AtariWriter after it was transposed from WordPerfect on her 386. After I mailed the final draft back to her & she booted up my 3.5" disk on her 386 PC clone & printed it out she refused to believe I did on it my Atari. Awesome things happen to an 8-bit when you plant 1-meg of memory in them & hook up a 44-meg removable media hard drive (the 1.44-meg floppies are just icing on the cake).

Ok, maybe it's not a 100MHz Pentium. But I know people with equipment 100 times more expensive than mine who can't write worth a damn & take 3 times longer than I do to crank out a manuscript that's no better than mine (or usually worse). For most productivity applications the user is the weak link, not the machine. I'm probably pushing the limits of what a 6502 can do but these machines are what you make them & I've squeezed every ounce of performance they will deliver. My 800XL is a serious computer & certainly not a nostalgic trip down Memory Lane in a showpiece Model T. Hrummmph!

- Ben Poehland

It's just a simple cable that converts Atari serial data into 19,200 baud RS232. It comes with some really nice, not so simple software that makes your clone emulate an Atari disk drive. If you have that cable for your ST that let's you use an 8 bit drive, I think it will also work with XFORMER sotware for the ST. I've used it to transfer a couple of files anyway.

Vince; I talked with Bob Wooley about the posibilty of a chip run about
4 years ago & at the time I think he estimated the minimum cost would
be approximately $100k. IMO: there's not much chance of that happening.
Just for comparison though, TI licenced the graphics chip in the
TI99/4 to Yamaha. Yamaha has continued to develop the basic design
& it is the graphic chip used in Nintendoes. I guess it's one of those
had'a should'a things. If Atari would have allowed the design to be
used in other systems & let other people 2nd source the chip we'd
probably be up to a ZTIA by now. But it didn't happen :-(

Joe; I know just a little about protecting intellectual property, mainly
patents. A major problem is software is allowed to be copyrighted.
IMO: This should have never been allowed in the first place. When I get
a patent, in exchange for the exclusive rights for the invention I have
to fully disclose all the technology involved in the invention. A patent
can be challenged/disallowed if somebody tries to repeat my process &
it doesn't work. Holding back info is reason for not granting a patent.
The life span for a patent is 17 years.
I'm not trying to say programmers don't work as hard as I do in the lab,
but in exchange for any exclusive rights there should be a disclosure.
Copyrights were designed for books! No mystery how they were written!
The only important thing was to make sure the author recieved his payment
for revenues generated by the work while he was alive or to his estate.
I see nothing wrong with giving programers the same status as technical
people vs the artist status they sometimes claim to be. Maybe even
a little less protection in that the should get the same protection
as somebody like Coca Cola or KFC's secret blend of 11 spices w/o
disclosure, 8.5 years with disclosure. Ah, if I were only king<G>!

In article <3d5j6l$65n@charm.magnus.acs.ohio-state.edu>, rfunk@magnus.acs.ohio-state.edu (Rob Funk) says:

>Yeah -- Doom bores me pretty quickly, and although it has great graphics,
>I was disappointed to see that the Jaguar version didn't have better
>graphics than the PC version.
>The thing is, so many people want to play Doom and similar games these
>days, so they get a PC and maybe one of those expensive adapters.
>
>My favorite game is still Joust, and I haven't seen a decent PC version
>yet. :-) Too bad I had to switch my Atari to a 9" mono monitor (the
>one for the Apple IIc) to make room for my new printer.

Uhh, I am familiar with the weird fact that some 8-bit game just have
that extra .. uh, you know, what makes them attractive even now
the graphics and sound are outdated.

But, Doom maybe has that uhh, you know a bit less, when playing alone.
After you've seen the levels once, twice, or maybe three times, it isn't
really attractive any more. Ok, the what is it, a cyberdemon, the one
with the rockets?, at the end of episode 2 in doom I, was nice a
bit longer.

That is single user. The network option of Doom is really great! Once
you've played 'netdoom' playing alone is boring. The new-ality has
weakened a bit, but when I play a game these days, it is doom against
others, harhar

The point of this? I don't know. Maybe just to say that the PC does
have some nice games. At least one.

Well, the dorm was ten or twelve years ago. :-)

I believe I should re-phrase my question: can Star Raiders be emulated on a
PC without any original Atari hardware? Since an emulator exists, I thought
someone might have made a cartridge or disk image of Star Raiders available.

Well, I'll probably stick my foot in my mouth on this one, but I think
the proper command line for a util binary transfer is:
UTIL -B W 'files' or UTIL -B R 'files'
You can also use /B or -b or /b, but the W or w has to be without
a - or / & follow the binary switch.
All else fails! To quote "The Time Lord"

>switching. Geez, gimme a break.

A definition of multitasking/multithreading/multiprogramming/multiuser and task switching is necessary when people want to discuss what can be done on the XL. I agree that is't quite boring.

>But where in a lot of these messages was any
>mention made of the 8-bit atari. No effort was made to even relate any part
>of the discussion to atari, in the particular message which I complained
>about.

Fact is that actually we also don't need a discussion of what can be accomplished with the hardware. The hardware is constant, so we know that the XL can do everything you want, disregarding the way you name it, except for securing privileged instructions' and protection of memory. Discussion of hardware/ multitasking would be boring too.

Discussion about what to be done with the existing software, well, yes, my view would be take too long to write down.

If people wonder why the h**l anyone would need multitasking, (or whatever you want to name it) they probably have never worked with a multitasked environment. Maybe just programmers, or especially programmers would benefit from it. I know I do on an AS/400.

Ofcourse, there will always be a lot of people that will never need to run more programs concurrently. What can I say, sorry for you?

I had bought a 600xl really cheap at a thrift store and it seemed to work
fine when I got it home. I only had one cartridge for it (pac man) but it
worked fine also. I found a bunch more carts at another thrift store this
weekend, but when I turned on my 600, it made a strange sound and made
the screen turn all sorts of wierd colors. It doesn't matter whether or not
I've got a cart plugged in. I get the same problem whether or not i use
a cart. Any suggestions? Thanks for any help!

>
> Also as an aside, anybody have a working 410 cassette drive
>they want to sell? Thanks for any info/leads!

B&C Computervisions has a limited quantity of M.U.L.E.....
they're selling them for 29.95.
They have 1010 recorders as well as XC12 recorders, both of
which are like the 410 only more reliable, and with two SIO connectors
so you can daisy chain them, unlike the 410.
B&C's number is (408)986-9960. They're usually there by
11:00 AM monday through saturday. They're in CA, so if you are in a
different time zone adjust accordingly.

Hope this helps.

>up. Dadburnit, 11 years ago I invested seriously in my 800XL system & over the
>years have upgraded it to a level of performance that compares favorably to an
>IBM AT-class machine & even does a few thing no AT can do.

Woah, there, Ben. Now in mentioning Model T Ford along with the
Atari, I certainly didn't mean what you read into it! After all, I'm
the one who was arguing that the Atari 8-bit is all the computer
anyone needs! Yeesh! :)

As previously mentioned, the Atari8 is my main computer. I
have a BBS machine that is a 286. I also "own" a 486-50. Notice the
quotes. I haven't used it since a month or so after I got it. Since
then it has been my SO's CorelDraw! box.
So I certainly wasn't being derogatory about the Atari 8-bit in
comparing us to those who still enjoy Model T Fords. I was focusing
on the pleasure aspect. One who uses a Model T these days does it
for pleasure. Ferrari's give some pleasure, and most Americans would
like to own one (if they didn't have to pay the insurance![G]). Only
a very few people appreciate the elegance and beauty of a Model T enough
to own and use one.
Similarly, most Americans drool over eithePentinum

oop. Modem went whacky for a minute there. pardon. :)
Start again..
Similarly, most Americans drool over either Pentium machines or
'040's. Only a few of us appreciate the greatness of our Atari 8-bit
computers.

I hope the above explains it better than I did the first time.
:)

[Article crossposted from rec.games.vectrex]
[Author was PDP11 Hacker .....]
[Posted on Tue, 20 Dec 1994 09:44:00 GMT]

The GT40 (VT40/VT11) was a hardware vector display. You set up a list of vectors in memory, and pointed the GT40 display unit to the start of the list. There were special values in the list to change modes (e.g. go to text mode), and to jump to a new address. The list was in effect an endless loop program for the display generator.

Seems like there was a predecessor to the Antic display list!

special values to change modes, yep. Jump to new address = load memory scan command.

Could Jay Miner have cut his teeth on this thing?

Source record: 96032

In a message dated 12-19-94, Ben Poehland said:

"The average life for a monitor is probably a little less
than 10 years."

I hope my monitors are above average. <grin>

My oldest is (a Commodore 1701) is probably closer to 11. The youngest two, a Tandy CM-8 and a Princeton MAX-15, are at least 5 years old, while the remainder were likely manufactured around '87 or so. The only failiures were a single chip in the 1701 at about age 2 or less, and one or more of the diodes in my Atari SM124 that form a bridge rectifier (and that monitor has seen almost daily use since '86). Even with my 8-9 year old Emerson TV, the tube may outlast the rest of the set. <grin> The tuner (electronic, not mechanical) is essentially gone, and in operation it generates so much interference that it interferes with channel 4 reception on any antennae near it. Thankfully, I had the good sense to choose a TV with A/V inputs, so I still get some use from it.

"Power supplies in monitors also are greatly stressed
& will typically fail in 6-8 years."

Seems I'm really doing good on this one. I wonder if all my monitors will start going the same year, since many are about the same age...much like the year I recall half the fluorescent bulbs in our high school going belly up (as they were installed at the same time).

"And composite monitors are not to be found any more."

Actually, there are relatively easy to find, especially in large sizes... they are just called "Television/Monitors" now. I'm buying one later this week...25", with color picture in picture, and both composite and S-video inputs, better than 400 lines resolution (less than $320 at Best Buy). Rig up a nice cable to hook it to the chroma/luma out on an Atari 8-bit an you have a nice monitor you can set a few feet away from. <grin>

Granted, the smaller and cheaper you go, the rarer A/V jacks become, and S-video appears to disappear altogether on anything smaller than 20" (and good luck finding it on anything less than 25"). Big monitors are one of the status symbols for PC owners, but somehow I doubt a 25"-27" TV sitting on one's computer desk above their 8-bit will make the same statement. <grin>

Still, the demands of videophiles will dictate that TV's with AV and S-video inputs will no doubt be around for as long as NTSC is, making monitors one of the lesser problems of Atari owners.

The people that will find monitors hard to find further down the road will be those with computers that require an RGB analog monitor that scans at NTSC, rather than VGA rates.

7664. Re: 8-Bits In 2005

Source record: 96034

In a message dated 12-19-94, Glenn Saunders said:

"Speaking of monitors. Eventually NTSC will be supplanted
by an HDTV standard."

As recently as a year ago, the FCC's plan was to renew no NTSC broadcast licenses after 2008. Of course, unless they hurry with the approval of a final HDTV spec, they might have to bump that up a bit. Even with HDTV finalized and sets on the market by 1996, that would give only 12 years of parallel operation.

"HOWEVER! It would be suicide to release an HDTV television
which can not support NTSC in some form of emulation,
letterboxed, whatever."

True. At least thru 2008, this ability would seem to be vital to the sales of HDTV sets, especially as their prices fall from "high end videophile toy" to "high-res video for the rest of us" levels. After that, I expect support for NTSC to dwindle, although if it could be provided inexpensively, some higher-end sets might provide it to appeal to persons with large libraries of NTSC videos.

writes:

>The real problem is software. Cartridges will last forever, but software
>on magnetic media will succumb to "disk rot" within 8-15 years. Especially

Hmmm. Interesting. I called 3M's "disk Hotline" on Monday, and
asked how long I could expect my disks to last. I claimed to be calling
on behalf of my company, which I said has lots of stored disks dating
from as early as 1981.
I was told that they would last indefinitely. I replied that
I understood disks would degrade over time. The guy on the other end
of the line said that this does not typically happen to disks, but it
does happen to tapes, so if we were using tapes for backups we should
replace them every 3 years with new copies.
I made a second call, talked to a different person (a woman),
and was told the same thing.
Perhaps I should call some of the other disk manufacturers and
get their opinions as well.
However, since they were honest about the tape failures, I
doubt the company would be lying about disks. Also, it is in their
best interest to say that disks degrade, a that would cause users of
them to buy more every few years in order to copy the old info onto
them.

In addition, I am sure we all have disks that originated in
the very early 1980's. I have an original Atari DOS 2.0 disk that came
with an 810 disk drive that was produced very early on (not sure,
but it did come in the same package as an 850 that had no finishee
er, finished documentation, labelled "for internal use only" and
"do not duplicate", which leads me to beleve the stuff was puchased
right after the Atari computers came out).
GEtting back to that disk, it still works just fine. I had
opportunity to try it out a few weeks ago, as I needed a fresh DOS
2.0 disk and couldn't find my others. Sine it is in a binder on the
cardboard holders Atari used to supply, I knew right where it was
:). Again, it worked fine. It is at least 12 years old.

I'm not saying you are wrong about the 8-15 year life of
computer disks, mind you. I only have one working disk that is that
old. It is always statistically possible to have a few disks that
outrun the average lifetime by a long shot.

But, it is something to think about...

I find this ironic because although computers rarely use NTSC signals these days, high profile videogames machines like 3D0 and Jaguar as well as every new console probably, has RGB output as well as split and composite video. Since they will (except 3DO which can't do it) probably use the full 640 plus overscan horizontal resolution, videogamephiles will obviously seek out RGB monitors for the best quality video from these new consoles. So there is a real monitor-gap here.

The shitty thing is that this problem does not exist in Europe because almost all modern televisions, no matter what price they are, have things called SCART connections which support RGB.

Perhaps this is because computers that output RGB such as the Amiga are more popular there, I dunno.

Any company that produces RGB monitors in the next few years in the age of U64 and PSX will definitely have an exclusive market. I see no reason why one couldn't sell monitors with RGB connections these days...

I see no reason why split video should be relegated to >700 dollar monitors or that RGB shouldn't be supported at all. It doesn't take THAT much more expensive electronics to add Y/C and RGB ports.

Nor do I see highscale game consoles switching to VGA-only resolutions anytime soon.

I have some old disks that started to smell funny about 8 years ago.
They smell like old crackers or something.

Some disks must degrade chemically in some way.

I've had disks become unreadable on me. I think it has more to do with
wear than age, but bad quality disks are probably more likely to age
badly just sitting there.

Just give CSS some business and turn your 1050 into a Super Archiver and
crack all your protected stuff so you can refresh the disks.

From: lucius@astro.ocis.temple.edu
Message-ID: <3d8bho$prg@cronkite.ocis.temple.edu>
Source record: 96045

The biggest problem with disks is dust and moisture getting inside the disk jacket. I've stored my Atari 5 1/4 inch disks in one of those plastic flip top things since at least '86, and none of them have gone bad.
They're all either Memorex disks or original software disks. Probably better quality control on these disks too.
Unfortunately, a few days ago my 1050 disk drive wouldn't work. I'd turn the switch and the power LED wouldn't light up. I think something went wrong with the power section of the drive.
I've had to fix the monitor (TV) and replace my old 800XL with a new XEGS already, so I think the hardware will go bad before the disks will.

(It's kind of frustrating now since I wanted to play a game off a disk I hadn't played for a while.)

In article <3d5q8d$hc6@sundog.tiac.net> krishna@max.tiac.net (Glenn M. Saunders) writes:
>Where is the 4K handler ROM located??

The 4k handler rom is U6 in my machine, and according to the blueprints I've
got, it's the same for th 1400 as well.

>
>All I could determine was that if I removed the SC-01 chip that both V:
>and T: were gone from the handler list.

I've not tried this with my machine, I'll have to give it a try and
see what happens not only with the handlers themselves, but what it
does with the PBI...

>So I assumed that the chip handled the speech and ALSO had the handler
>information. I located the OS and Basic ROM and found no other evidence
>of a mystery handler ROM. When I replaced the OS with a MUX ROM, the
>handlers still loaded in, so they are not internal to he OS. The 1400
>series uses, as far as I can tell, a 100% stock XL/E OS.

At least not in my 1450 (though I'm told by Mike H. that because if its
short size it's really a 1400, even though it has the buss connector for
the disk drive and the 12V supply...) the handler for the T: and V: are
seperate from the SC-01. And the OS is byte for byte the same as what's
in the 800xl.
>
>The SC-01 chip appears in my machine as an EPROM with a sticker over it.
>It's funny because I don't associate a hardware speech synthesizer with
>an EPROM--an EPROM to me means code, and that would suggest that the
>synth is nothing but software!

very odd, in my 1450 the SC-01 is a stock SC-01...not an eprom. SC-01 is
U32 (if I recall correctly). I do know that the speach you hear when you
go to the test menu is stored in the handler rom...as well as a lot of
information that looks like it's telling the sc-01 how to handle the P
option.

Speaking of options, I'd guess you know about the P, S, and N options, but
according to the handler there is a forth option, U (though it doesn't seem
to do anything different than the N option.) Oh well...

>for your ST that let's you use an 8 bit drive, I think it will also
>work with XFORMER sotware for the ST. I've used it to transfer a couple
>of files anyway.
>Rick
>

So would it be possible to connect the 8bit "disk drive/printer/cassette"
port (what do you call it anyway???) to the RS232 port on an ST?

I presume that the cable I have, which I honestly can't remember the name of
the program that used it, is the same as the one used for SIO2PC?

If so, then presumably I can just write a program for each computer (ST and
8bit) which can create a handler on the 8bit that uses the ST as a virtual
disk drive?

Or perhaps there is a program already written that does this? I don't have
a PC and have no intention of buying one - but I would like to be able to
transfer data between the 2 computers.

Any help would be most appreciated,
Richard =8-]

If there was a way to modify speed and pitch the speech would be great,
but as it is it is like a crippled alien voice box.

The SC-01 itself has the ability to do this, but since it is talked to
through a PORT, I doubt there is much direct control of SC-01 parameters.

I've heard of singing demos, but the guy I heard this from is the least
reliable of sources and he never came up with the goods.

7673. Single Joyport printer adaptor!

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-21 08:05:15 UTC
From: naina@technet.sg
Message-ID: <3d8njr$dlf@raffles.technet.sg>
Source record: 95924

I was going through my collection of 8-bit Atari stuff and one thing caught my eye. It was a peripheral that the Atari Club in Singapore designed and built in 1983:- a single joyport parallel port interface. This neat little sucker plugs into the second joyport on any Atari 8-bit and gives you a hassle-free parallel port with respectable speed. Of course, you would need to install a little (1K) driver before you start printing.

Anyway, our Atari club has long since dissolved and I'm more than willing to release the schematics and the driver code to the public domain. It really is a very simple and elegant device and most people who know which end of a soldering iron to hold, can assemble it easily. Email me if you want it.

How about inflation? Ny understanding is that cartridges for current
game consoles sell for about $50-$70 (maybe more). Now, from 1984 to
now (1994 for a few more weeks), is 10 years- that's a lot of time
as far as price inflation goes.

Actually, there were several entries in the IBM GUI add-on market, including TopView (from IBM- didn't last), early Windows (also didn't last,was later revived by MicroSoft, but was originally a bomb), GEOS (which is still kicking around) and GEM (from DRI). GEM lost out for several reasons. First, Gary Kildall wasn't much of a businessman (no offense, alot of what he did was important and in my opinion good for the micro community), and second Apple's evil legal maneuverings against DRI. DRI backed down and basically let GEM fade. When Apple tried this legal nonsense in the form of a lawsuit against MicroSoft and HP, however, they got their you-know-whats kicked in court. GEM actually ran on top of DOS, on the IBM systems.

I would like to thank people for the support they have shown me by purchasing some software from the lists I have posted to c.s.a.8bit recently, however I can't do this because nobody has ordered anything, not even enquired about anything!

I sell JAWBREAKER, MOUSEKATTACK, ARENA, BUBBLE ZONE, GTRACKER and SUPER PRINT-LAB XE as well as limited stocks of other commercial software, which includes: Halley Patrol, Gato, Desert Falcon, Solar Star, Summer Games, Dropzone and Cyborg Warrior at the moment.

What is wrong with these? Does everybody have them all? Are the prices too high? Is the software not good enough for you?

Somebody please respond and tell me why YOU aren't buying anything. Okay I can't force people to buy items but when everybody is complaining about no support and games aren't available anymore it makes me wonder if anybody REALLY cares anymore! I'm just glad providing Atari support is not my living or I really would be in trouble.

RICHARD GORE

What about GEOS? It had nothing to do with any of this, as it had not become at all popular to run it on an IBM until recently, as with AOL's front end. GEOS presently runs on top of DOS also.

(I'm posting this, maybe to generate some discussion for R. Gore and
DGS, that they may appreciate. It's a letter to R. Gore.)
(R. Gore asks why he' received little or no response to his
ads for software.)
Mr. Gore, I'm sure most c.s.a.8 participants are sorta
hackers that don't do a whole lot with games and secondly
have a large collection of software/hardware. The prospect
of putting cash in an envelope is also a bit daunting. That
practice is not done much in the U.S. where most of c.s.a.8
callers are from. International money cheques are foreign
to us also. Since you seem interested, I'll tell you my
software purchases lately have been war simulation games
from SSI mostly from American Technavision. With an
American company, you call them up, give your order and a
credit card # and that's all you have to do. I would be
reluctant to put cash in an envelope and mail it to England.
I've never mailed anything overseas and don't even know what
the postage would be. I would guess that the European
market may be more comfortable with ordering things from the
U.K. I don't think people are averse to the U.K. in any
way, just haven't any experience ordering things from there.
Your software, I'm sure, is excellent. I have very little
interest in the joystick type of games you sell, as I have a
large collection of them and know very little about the
qualities of the games you sell.

I just joined this newsgroup out of nostalgia for my old 8 bit Atari. I regularly use PC's and Unix machines but I still have a special place in my heart for my Atari...still the best designed computer ever in my opinion.

My question is this: I have a 130xe with 2 1050 drives and a xmm301 modem with which I use 1050 (?) express. Perhaps I should have written used instead of use above since I haven't used the modem in years... 300 baud makes me crazy. I remember there was an interface made by Atari, the 850 I think, that allows the 8bit access to a std RS-232 serial port. If I could get such a device then I could use my PC's 14.4kbps modem on the Atari... a vast improvement. Where can I get one of these things, or the equivalent(?) P:R Connection. Also what software will run my Modem at high speed... my current terminal program is limited to 300 bps.

Thanx.

There are a number of options for your Atari. One is to use your PC for
downloads, then transfer programs via SIO2PC. That's a PC serial cable that
hooks into the SIO line on the 8-bit, with software to make your PC emulate
up to four disk drives.
Another option is to build your own interface. A friend of mine is building
an RVERTER compatible interface, based on the MAX232 chip, I believe.

PR Connections and 850s are available in the used market - you can check the
ads that pop up here periodically.

For term programs, BobTerm has the most features, but only offers VT52
emulation. FlickerTerm does great VT100 and handles 9600 with a decent
simulated 80 columns, but has no capture or transfer ability.

Dave

OK. I wonder if it's the same company? Apple II clones: Orange,
Franklin, Lazer, Laser.

How much do those things cost? In $US would be fine as I can convert without
problem.

Richard =8-]

PS. My 800XL is dead - used to come up with a blue screen, no cursor or
anything else - not it just comes up black. Power Supply is fine though.

This sounds to me as if you have a bad DRAM Chip. In the few cases of dead
Atari 8Bits that I'e run across, a simple matter of replacing the DRAMS
revived the 8bit. {All of them had the same symptons, power light on,
but nothing but a blue or black screen.}

Hope this helps,
--BRiT

>

Wow! Having a bad day Richard? :) I had a look at your list and did not see anything I needed/wanted. Some of the items in your list are already in my collection, and others (Arena for instance), I've already seen and am not interested.

One sad fact about sales is that there are times when you get no bites at all. Now, if you had some of the newer stuff like Draconus (got that one too), you might get some orders.

But when you don't get any response, don't lash out at your potential customers...it is really bad form. Don't get me wrong, this note is not a flame. Everyone knows what it means to invest in some software, and see your inventory stay frozen; the frustration level is pretty high.

I suggest you post on some of your local bbs, and possibly a periodical which still carries Atari information. If it is any consolation at all, I've noticed that the posters on this newsgroup are for the most part, Atari users from the mid-80's, when the machine was state-of-the-art for home computers, thus they already own/have owned most of the titles on your list.

Best of luck to you :)

Regards,

Vince

From: James King <jeking7@delphi.com>
Message-ID: <RE2VfLL.jeking7@delphi.com>
Source record: 95933

Just picked up additional cabling and a mini-security montior for use in my kitchen, and will be running 50 foot or so of 34pin ribbon cable under my house (from my den/computer central to the kitchen), and was curious if anything has been created for quick chats between MUX workstations? Does a .COM file exist for SpartaDos to allow pipe chats between mux slaves? If not, how difficult would be to create such a program?

How about a discussion about working with the MUX?

7702. XL Parallel bus

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-22 03:22:14 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELWOAGVAUp@stingray.manawatu.gen.nz>
Source record: 95916

Does anyone have any information on the parallel bus on the XL and XE?
I have pinouts from Mapping the Atari, and I have one article from Antic - part 2 (Feb 1985) of 4 articles.

I would love any information anyone has, and perhaps someone has the issues January and March 1985 with the remaining articles in it?

The March 85 issue supposedly had a "serious design for a sort of baby 850 Interface - a serial device useable for driving modems and such".

Basically, I am looking for any way of transferring data as fast as possible between my ST and 800XL. I figure that it should be possible to make a parallel or serial interface, parallel would be preferable ofcourse, for speed, but even 19200bps should be faster than the 8bit drive (???)

Any help would be most appreciated.

Merry Christmas etc.
Richard =8-]

Richard: most of the PBI specs are available at the umich archive in the file 1090XL.ARC. It's the specs for Atari's ill-fated interface box, but includes all the dope about the PBI as well. Unarcs to about 65k or so.

UTIL -b W 'files' is the proper format for the util command, and all else fails?!!!!!!! Well then there must be more than one version of util with different docs. I got my docs from the built-in help file also, and it gives this: UTIL /W /B A: filename.ext

The post I am responding to didn't even include the drive number in the
format!

From: richard@stingray.manawatu.gen.nz
Message-ID: <ELWWAJUSUp@stingray.manawatu.gen.nz>
Source record: 95931

Is it possible to get an index of the 8bit index from a.a.u.e. with comments?

I have only recently come back to the 8bit world and have no idea what all those cryptic files are supposed to be about.

Unfortunately I no longer have ftp access, and have to make do with Bart, and also to make things worse, I have to pay per Meg transferred =8-[But if there is an index with comments, could someone please tell me where, and then I will try get access to ftp (via a friend) and grab it.

Thanks and have a fun Christmas everyone.

PS. Could Santa please send me the Action! Cart. and anything that goes with it?

7708. MASSIVE AUCTION VI -- update #6 (includes Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-22 11:20:26 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3dbndq$41g@usenet.INS.CWRU.Edu>
Source record: 95932

SIXTH UPDATE:

MASSIVE AUCTION VI -- ALL ITEMS RECEIVING THE MINIMUM BID WILL BE SOLD!

This is a rather large file (just under 34,000 bytes), so if you don't like
large files, and/or auctions, PLEASE stop reading now. You have been warned!

Games and/or game systems included in this auction are:

ATARI 2600 games and systems ATARI 5200 games and systems
ATARI 7800 games ATARI LYNX games
ATARI 8-bit games and systems COLECOVISION games and systems
COLECO ADAM system COLECO 2600 ADAPTER with 2600 games
COMMODORE 64 system INTELLIVISION games and systems
INTELLIVOICE systems ODYSSEY2 games and systems
PONG (BENTLEY) systems SEGA MASTER SYSTEM games and systems
TOMY TUTOR game TEXAS INSTRUMENTS 8-bit systems

NOTE: My want list is almost ready. If interested, please request it.
If you have a trade list and/or want list, please send it. -- MJN

I will post updates approximately every 24 to 30 hours, and then delete the
last update after I'm sure the new one is accessible. I will also e-mail
the list to all bidders, and anyone who requests to be placed on the auction
e-mail list.

Mike

P.S. I RESERVE THE RIGHT TO CORRECT MISTAKES MADE WHILE TYPING THIS MESSAGE.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:

1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, DECEMBER 23RD.

2) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.
-- YES, THIS USED TO BE RULE #9. I'M NOT KIDDING!

3) IF YOU DON'T FOLLOW THROUGH ON A HIGH BID, YOU WON'T BE ABLE TO
PARTICIPATE IN FUTURE AUCTIONS. (SEE AUCTION RULE #2)

4) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

5) BUYER PAYS ALL SHIPPING COSTS.

6) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

7) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE USUALLY GIVEN
PRIORITY (UNLESS THE TRADE OFFER OVERWHELMS ME). I COLLECT FOR OVER
45 DIFFERENT SYSTEMS, PLEASE FEEL FREE TO SEND ME A TRADE LIST.

8) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

9) IN CASE OF TIES, FIRST BID RECEIVED WINS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, BY EITHER CHECK OR MONEY ORDER,
DRAWN FROM A U.S. BANK BRANCH. CANADIAN BIDDERS MUST SEND A
CANADIAN POSTAL MONEY ORDER, PAYABLE IN U.S. FUNDS. THIS IS THE ONLY
WAY I HAVE FOUND TO DEAL WITH MY FRIENDS TO THE NORTH (MY BANK IS VERY
PICKY, BUT THE U.S. POST OFFICE WILL CASH A CANADIAN POSTAL M.O.)

*****

SOFTWARE:

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

* = (after minimum bid) indicates a STRONG preference to trade that item.
TRADE = (after bid) trade pending, bids still accepted in case trade not made.
XXXXX = (after bid) item has been traded, please don't send further bids.

ATARI 2600:

****

HARDWARE:

NOTE #1 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I ran out of used RF switchbox's in the third MASSIVE AUCTION, sorry.

NOTE #2 FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain systems (they are marked) you will have the option of buying a BRAND NEW power supply for $10 that is virtually identical to one sold at Radio Shack for $13. This power supply works with a lot of systems. It features six (6) plug adapters, changeable polarity (positive or negative), "LED" lights to indicate proper voltage, and can be used on the following settings:

INPUT: 110-220 V, 60-50 Hz, 9W
OUTPUT: 1.5, 3, 4.5, 6, 7.5, 9, and 12 V DC.
CURRENT: 500 mA.

Radio Shack's model DOESN'T include 1.5 or 12 V settings, and is only 300 mA!

I just ran out of most used power supplies in the last MASSIVE AUCTION, sorry.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION
NEW POWER SUPPLY OPTION

ATARI 2600 SYSTEM, WITH ONE (1) ATARI JOYSTICK, ONE SET OF TWO ATARI PADDLE CONTROLLERS, ONE ATARI VIDEO TOUCH PAD CONTROLLER, AND TWELVE (12) CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

7710. Rare Game: Hard Hat Willy

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-22 15:54:26 UTC
From: mtmr@walsh.dme.battelle.org
Message-ID: <mtmr-221294105814@walsh.dme.battelle.org>
Source record: 95951

I guess 'Hard Hat Willy' is rarer than I thought.

It seems few people had this game as I talk with other 8-bitters on this group.

In the game, you control Willy, who wears a hard hat (hence the name) and you walk around a big room (that scrolls) and smash up eggs with your hat (it raises up from your head and smushes them when you press the fire button). If you don't smash 'em they eventually hatch and birds come out to attack you.

This was one of the last games I remember getting for my 8-bit, circa 1985. Does anyone remember this game, and if so, who made it?

Oh yeah, it was in Graphics mode 7, had real smooth animation and scrolling; in fact it was one of the cleanest, meticulously programmed games I ever saw.

Yah, I've got it too....don't have it in front of me (actually, it's about
2300 miles from me right now). Don't recall the company that put it out.

>Oh yeah, it was in Graphics mode 7, had real smooth animation and
>scrolling; in fact it was one of the cleanest, meticulously programmed

Yeah, and you forgot to mention that it's a lot of fun too! There's this
weird segment where you "grab" onto a bird passing overhead. You extend your
"ears" way up until your hardhat hits the bird, the hardhat sticks to the bird and drags
you along, while you have to modulate your ear length to pass through some
tunnels and obstacles.

I think you'd have to install some kind of interrupt handler to await pipes.

As far a I know:

Pipes only work when both ends are sitting there waiting to receive the
data. If one end is doing something else, I think the msg will just be
lost.

My good ol' 130XE seemed to have died after seven years of labor. So,
I'm looking for someone w/ a 130XE in good or better condition for sale.
I'm looking for the standard computer w/ 128K and the right power supply.
Manual is optional, as I already have it. I'm willing to go as high as
$50, shipping/COD charges included.

Thanks.

BEST Electronics lists a 6 foot SIO cable for 12.00, part number CA015900-01.
I use one in my setup, as the computer is in a slide-out keyboard and
the distance from it, through the hole in the back, to the nearest
SIO device is just under 6', when the keyboard drawer is extended for
typing. It works fine.

As for something bigger, I dunno. :(

I have a question about this man.....
I know this man like to sell his stuff and like to get the most money out
if it but my problem is that he post this LIST every 24 hours so that is
about 6 or 7 X 34 kb every week and he comes back every month..
And I have to download ALL of those message, ALSO the 6 or 7 times that
34 kb a message....
And I think I'm not the only on that have do download ALL the mail and
maybe there are also people that has to PAY for there mail...
So let me know if you also like to see that he stop with his Selling list
in the comp.sys.atari.8bit area......

I have also try to open his eyes so I have send him back 2 of his lists but
he go's on....

So hope to hear from ALL of you who also DON'T like his list...

> Send all bids to: dw901@cleveland.freenet.edu
>
> Michael J. Novak Jr.

This is the Man where is was talking about.....

All of you who don't like his idea of posting his list every 24 hours let
me know...

7723. Is it April already?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-23 02:57:15 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <xc72HfD.ransom22@delphi.com>
Source record: 95954

Atari Corp., in a surprise move that shocked Wal Street analysts, today announced that it will be reviving its so-called 8-bit computer line in mid-1995.

The computer and videogame maker plans to offer these computers at a very low-cost to consumers in order to win back marketshare it once had.

"By giving consumers all the power and functionality they need at a fraction of the cost our competitor's charge, we expect to have recaptured a 24% share of the computer market by the end of 1995," said Sam Tramiel, president of Atari Corp., a Sunnyvale, CA based firm which was once a leader in the home computer market.

The proposed system will include a computer centered around the venerable 6502C microprocessor. While it will retain full compatability with the previus 8-bit line by being essentially the same as their 400/800/XL/XE lines produced throughout the 1980's, it will boast a full 512 kilobytes of RAM. In addition, the complete system, dubbed "Atari Classic", will include a 1.2 MB, 5 1/4-inch floppy disk drive, an inkjet printer (rumored to be manufactured by Canon), a word-processing program (titled "AtariWriter 95"), Atari DOS (a command-oriented disk operating system similar to Microsoft's MS-DOS), and three game programs (Star Raiders, Pac-Man and Centipede). The complete package will retail for less than $250.00.

The company also has announced plans for additional accessories. These include a 14.4KBaud modem that will reportedly hook directly to the unit, a color printer, a monitor, various sizes of hard drives, and many different controllers. Most are scheduled for fourth-quarter 1995 release.

Wall Street traders reacted favorably to the announcement. Atari's stock (AMEX symbol ATC) shot up from 5 1/4 to 24 1/8 in heavy trading on Thursday.

Jack Tramiel summed it up most succinctly when he said, "We're back!"

==========

Okay, okay, it'll never happen. But it is the Christmas present I most wish for. :)
Hope you enjoyed reading my little tale as much as I enjoyed writing it.

Merry Christmas,

Joe Walsh

7724. UK 8-bit Users

Having recently returned to the 8-bit with a dirt cheap "ready-made"
collection that I've just bought, I'm dying to hear from other UK Atari
8-bit Users who wish to help me catch up on things.

Are there any user groups left in the UK? Do Page 6/Atari User still publish?
Can I buy Atari gear from any established companies (hobbyists?) anymore?

Feel free to E-Mail me with answers, lists of software/hardware for sale
or swap, or just for a quick chat! I'm not fussed.

Back on the 8-bit after 7 years and it feels so good! :-)

Cheers, Ric.

I think you are going overboard trying to equate mux pipes to the way things like "write" work on unix machines. If you are in a word processor on one Atari, odds are you can't install an interrupt handler that will do anything, let alone store email, on that slave. If you are in DOS, fine, but if you have a custom graphics mode set up or what have you, how is it going to print? The Atari doesn't multitask like a unix machine where no matter where you are someone can kick in with a write. It's not practical either to have some kind of chat or write system and have your end hang for 10 minutes until the other guy just HAPPENS to drop back to DOS or something where the handler can catch the message which is being sent and resent until received. The only way I see you could work this is if the handler was A) compatible with all software, and B) when it gets something, it snapshots out the program you are in and snaps in the chat or write program. Don't expect much software to like that kind of kluge, nor the guy on the receiving end enjoying having his software interrupted.

To me, Pipes have 2 applications:

1) multiline chat/games for BBSs
2) parallel processing programs using Pipe to transmit control data and results

For both of these applications, the software has to be deliberately written to take advantage of the MUX. Outside of the routines in which both sides are handshaking, each program on each slave is an island unto itself.

: in mid-1995.

I can do better tha this, just give me a few minutes.

What the hell, here's a NOVEL for ya:

At the summer CES 1995:

Atari Jaguar was a hot booth not only for the new games, but for
the nostalgia of their very popular Atari 2600/7800 emulator CD. Gen Xers
were waxing on about how faithful the emulation code is right down to the
flickering dragons on Adventure. Hot on the heels of this comes the debut
of a new exciting product, the Jaguar computer system.

In actuality, the Jaguar computer is several operating systems in
one. Due to the fact that the Jaguar has a 68000 processor in it, GEM
was easily ported to it and so Atari's ST computers now live on through
the Jaguar. The Tramiel's said that this was an important move to give
their frustrated computer customers something new to play with, despite
the fact that the 13mhz 68K is no barn-burner. However, also included
are OS/9000 and Linux. Most curious of all, even the Atari 8-bit is
supported. The demonstration explained how this particular emulation works:

'It was difficult trying to pull off 1:1 throughput when emulating a
dissimilar processor on a machine that is only about 7 times as fast as
the emulated one. So instead we included a 65816 in the cartridge. The
65816 was included because Atari 8-bitters always wanted a 16-bit
solution and it wasn't that much more expensive. The internal circuitry
and the 68K essentially controls when and how the 65816 gets control of
the system, and graphics calls from the CPU that would normally go to
ANTIC/GTIA/POKEY and the like are rerouted through the new chipset and
handled via emulation code which is running IN PARALLEL. Essentially
this sets up Tom and Jerry to emulate the graphics using their analogous
features. When there is a call to enable PMGs, the emulation code is
there to catch it and throw commands at the object-processor to put up a
hardware sprite. It's all handled on the fly and it is very slick.'

Hardwarewise, the cartridge part of the emulator is a large unwieldy
beast. It starts like a normal cartridge then goes into a flat T shape.
Like the CD unit, it also sports a passthrough in the middle-far end and
will deactivate itself in the presence of a game cart. The top of the
cart can be popped open to reveal several components. One is a battery

backed clock. 2nd is one standard 72 pin SIMM slot. This can receive up to 16 megabytes of RAM which is the limitation of the cart port's adressability (read on for late-breaking news on how this limitation was broken). The 68K and the local 65816 can both access this memory and/or the internal 2 megabytes, although a tiny chip also inside provides 64K of standard RAM access for the 65816 in 8-bit mode or when enabling chip/fastram and kicking the clock speed up to 10mhz. A third mode is also available called Atari+ where the emulation is slackened so that effects that would have been impossible on a 10mhz 8-bit are now possible, as well as direct Tom and Jerry control from the 65816. Also on board is a SCSI-1 controller, with a 50 pin connector directly under the T in the front. This is naturally usable by any of the emulations as they were specially written to be able to allow various FMSs to coexist on the hard drive. Next to the SCSI port to the right is a standard 8-bit SIO connector and on the far-far right, MIDI connectors. To the left of the SCSI port there is a standard parallel port and farther still, a 34-pin floppy connector. I/O control circuitry for all the devices lies in a daughterboad underneath the visible SIMM slot area. The floppy connector can handle most all formats, is accessible by all emulations, and has a configuration menu available to control various parameters such as the various double sided modes on 5.25 inch disks and speed modes for compatibility with old protected 8-bit software. Farthest over to the left is the keyboard connector DIN. The keyboard is a standard IBM type and various keys correspond to Atari 8 specific functions as well as ST functions (templates and key-cap info provided). On the left hand side of the T is the Atari ST cartridge port. Developers weren't sure if they wanted to include it, but they felt that it wouldn't hurt.

The emulations are written specifically to harness the DSP port as a powerful serial port. Limited falcon emulation allows the usage of the DSP port but naturally kills the serial port at those times. Since ISDN is on the way in, Ethernet had to be provided some way. This is accomplished by an optional passthrough that plugs into the CD unit before the T cart. It harnesses some of the CD interface and buffering circuitry to allow very fast ethernet data rates. Another feature of the ethernet cartridge is a traditional FIFO buffered serial port to help free up the DSP for other things. Or you could access both ports for various applications, multiline BBS, etc...

On the emulator CD is not only the operating systems, but tons of utilities and public domain programs. Once the CD is loaded into the OS SRAM you can remove it and access it as a standard 2X CD-ROM drive. ISO 9660 read capability is offered to all emulations, and PhotoCD is available to the ST/Falcon emulations. Coming with all this is a tiny little 34-pin passthrough device which serves as a starter FLASH ROM drive off the floppy port with storage of up to 2 megabytes (or more with compression enabled).

Also, adapters are provided for the controller ports to allow 8-bit and ST controllers. Since these are Y adapters, the standard Jaguar controllers are also always plugged in. A switch on each adapter can be

turned on that will allow you to use Indy 500 rotor controllers with such games as Tempest 2000 or Major Havoc 2000 or driving games while still being able to use the Jaguar keypad. This comes as a relief to many since a formal Jaguar rotor controller was never released. The adapters are also available separate from the emulator and are not dependent on the software emulation.

In addition to the emulated and already existing operating systems like OS/9000, a brand new operating system has been developed to take advantage of the Jaguar in the most unrestrictive way. It's called System J.

System J was designed by a cooperative of many talented programmers, many of which were once C= developers but who left after the liquidation of the company and never went back to the current owners.

System J bears many similarities to AmigaDOS 3.1. It is preemtively multitasking, and has both a graphical interface and command line available. Also, most of the operating system fits on the 512K of OS SRAM which acts like ROM and does not eat up much RAM. The rest loads off the CD or can be installed onto the HD for faster operation. It supports such features as reentrancy, the use of datatypes, shared libraries, and icon tool-types. Virtual or protected memory is not supported because of the limitations of the 68000 (read on about late-breaking news). The operating system was developed specifically to take advantage of the custom chips to assist the 68K as much as possible. Object processor directives are simplified by the way the OS distributes commands to it so that instead of programming to the metal a pleasing simplification of operation is in place. Standard graphics modes are supported through the OS as well as support for customizing them on the fly painlessly and easily. The DSP can be accessed directly, be used as an FPU, or as the serial port. Provisions were put in place to try to allow all 3 without interrupting an online session. Palette/mode preferences support up to a full 24-bit desktop at 640x480 interlaced plus overscan as well as scrollable desktops of larger sizes. Developers also say that they are leaving the resolutions open ended due to the programmability of graphics just in case of HDTV or multisyncs become popular. Utilities to dump JPEGs in as backdrops are truly amazing. Also on the programming end, parallelization is supported by means of special calls to set up parallel routines on the other processors. Instead of forcing the 68K to do ALL the work, the RISCs can indeed be called upon to chomp on mainline code, for they are a lot faster than the 68K. Normally, the OS handles this and parallelizes things automaically. But in your own code you can learn how to write closer to the metal this way. The designers said they did consider focusing on one of the RISCs as the main CPU but decided against it because although they ARE faster, they are designed for the sound and GFX and overall would work best as the A/V subset to the 68K. It may all seem confusing, but the end result is that the actual throughput of System J certainly is amazing. Graphics put almost no overhead onto the 68K, leaving it to number crunch. Overall the machine appears to run as fast as a 33 mhz 68030 by taking advantage of the RISCs and using the DSP as an

FPU. Not a speed demon by today's standards, but it is amazing for what it is.

All this is well and good, but what can you run on it? Well, at the present time a few different software projects have been completed. Atari farmed out its software in a way, by going to software houses and instead of courting them, they PAID them to port their software over. At the same time, they cut a deal so sweet that the companies could not refuse. Atari knows now that software sells computers and it was worth it for them to do whatever they could to insure a few good titles at the debut of System J. Titles include Pagestream 4.0, Excell, Wordperfect, and one Atarimade title called Kitty Corner.

Kitty Corner is the starter software tha comes with the Jag computer. In a way it is a lot of little desktop utilities like the clock and memo pad and stripped down database and spreadsheet functions. But it also has a full-fledged terminal software supporting all sorts of emulations (Even a faithful 40 collumn ATASCII!). Due to the fact that some people might not be using RGB monitors with their Jag, scrollable 80 collumns is also supported to avoid artifacting. Kitty Term, also has fax functions and also has a powerful macro language that can you can actually use to program your own BBS through! More than one copy can be launched to take advantage of the 2nd serial port or ethernet (ISDN) port on the optional networking card. You could set up a fax sentry or have a multiline BBS or dial out with a single line BBS active. Another feature of Kitty Corner is a Norton's Tools kind of package disk utilities, backup tools, and the like. Support for SCSI scanners and tape streamers, it's all there. It also has builtin hooks for ethernet networking options with other Jaguars, but the networking cart must be present to use it obviously.

One curious package that Atari was lucky to score was a port of NewTek's Lightwave 3D, now in version 4.1. Normally Lightwave requires 8 megabytes on an Amiga, and you'd think the 16 megabyte limit of the Jaguar might impose some limitations on what you could accomplish with it. Newtek, however was intrigued enough with the machine that they managed to write a custom memory manager system by slaving one of the RISC chips. They suggested a couple changes in the T cart and as a result, now 32 megabyte SIMMS can be used, and by using this MMU TSR, memory will be banked as needed. Real or virtual memory up to 128 megabytes is supported. Banking may seem like Intel backwardsness to some, but 16 megabyte chunks don't impose too much overhead on throughput. NewTek was on hand to demo the still incomplete 4.1j version. Throughput, they say, when rendering to the gfx chips directly is comparable to a 68030 50/50 Amiga, which isn't bad. When sending output to a single frame VCR, the TOM and Jerry 24-bit output can be used as the final output. By using JagPeg compression, direct from disk animation playback at very high quality is possible. LW 3D will be distributed on a Jaguar CD-ROM. Atari is planning on licensing the NewTek memory manager and making it part of the standard System J package.

The price of the T cart is $100. The networking passthrough cart is $50. Lightwave 4.1j is an initial bargain at $500.

Obviously to get much good use out of it you'd want to also buy a large SIMM module and set up some floppies and a hard drive in an external tower case...

How does Atari plan on marketing it? Well, they plan on creating ads using LW 4.1j to boast about that, and their intended market is primarily the educational one. Sales to schools as cheap multiplatform workstations, or to students directly as an ideal personal computer or starter computer. They say the sky is the limit with such a versatile computer, let alone the already established game titles. At the show, several educators expressed interest in the Jag computer to purchase in for their schools. Almost everyone found someting they liked about it, with so many operating systems to chose from, it was hard not to.

A special computer package price of only $400 for the JagCD with networking cart and T cart was also announced to coincide with the lowering of the price of the JagCD to only $250. Atari sees these price changes as crutial to keeping the Jag alive when the PSX is introduced in a couple of months for around the same price, and they insist that manufacturing costs have lowered considerably since they first started making Jaguars in the fall of 1993.

>I can do better tha this, just give me a few minutes.
>
>What the hell, here's a NOVEL for ya:
>
> At the summer CES 1995:

Well, there you go. Different strokes for different folks. :)
I'd be happy with a revived 8-bit line, others such as yourself would
rather have a new computer system that faithfully emulates many computer
environments. I guess as long as we're dreaming, we may as well dream
BIG. :)
There is a fundamental difference in outlook at work here. There
are those (like myself) who are essentially happy with their Atari 8-bit
machines. Then there are those who, like you, see it as a nice machine
for some purposes, but who require at least one other environment in order
to fulfill all home computing needs.

I'm not saying that either outlook is "better" or "right". I
only mention it because it has been the driving force behind our
opinions in not only this discussion, but also the previous discussions
I began, such as the "Atari is the only computer you will ever need"
thread.

I would add one thing to your "novel", if I may. In

In a move reminiscent of the way Coleco handled a similar
situation, Atari released a single-unit version of the Jaguar Computer
for those who do not already own a Jaguar videogame system.

:)

I disagree. Multiline chat was enabled on the Pro! system, and works just
fine. Something along those lines for the DOS level could be easily
created. In addition, page attempts could simply be buffered to a file
if the receipient is unavailable.

7732. Re: XF551 Drive Size and stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-23 17:40:26 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <129866@cup.portal.com>
Source record: 95956

The internals of a XF551 are just an 8040 or 8050 CPU, one of the
Intel 8031 type micros but with 256 bytes of ram. The controller is
a Western Digital 1772, this is the same controller that's used in
the ST, it's kind of pricey ~$25 *IF* you can find them. The ROM is
an 8k 2364. I think the code was written in 'C since it's so bloated.
The drive does not support 1.2 or 1.44 but what a lot of people do
with there ST is replace their clock circuits with twice as fast of
a crystal & use a programable divide by two circuit & switch between
the two for using 1.4 meg drives. I don't know if this would be possible
on the XF551, but is is curious. Bob Puff said he found a bug in the
ROM that allowed a sector to be written without the motor being on or
something to that effect. Sparta DOS got bad mouthed a lot at the
time for being buggy with a XF551 & I suspect this bug could have had
something to do with it. As is Bob Puff's style, when asked how to fix
it he didn't respond, but came out with his upgrade ROM. (Hey! He's a
business man not a saint!) All XF551's have problems with there circuit
boards so the solder joints for the serial connectors pop out, converting
the 34 pin connector to a longer one for a different drive lifts solder
pads, it's really a mess. It's only a single sided board with a lot of
jumpers <about 40> on top. Prices: I've seen them go for as low as
$60 for a used one, but in the last B & C computer catalogue I got
the had raised the prices on everything 8 bit except software! No
excuse for not checking, but I think they want something like $229
for a new XF & 1050's are close to $200. Ditto for expanded/garranteed
XL's & XE's. The power supply in the XF is IMHO: Feeble. It's so close
to the minimum that not all 5.25" drives will work in it.

One last bit of kibble. Have you guys tried adjusting the speed of the
1050 to 300 RPM before formating/writing the disk used in the transfer?
If you want to give this a go, just run a disk RPM test while adjusting
VR2 on the 1050. There may be a problem with the IBM trying to center
on data, ergo it's gets the first part of the data, but the 288 RPM
data of the 1050 gets out of sync. The resistor is located

RE: The joystick thang. I'm the major limiting factor. I know it got
a lot of D/L's from CIS, but I've only heard of maybe 2 people that
actually used it. One person nagged me into writing a 1200 baud
version for transfering files from the IBM, said he had a lot of data.
I get bored a little to easy so after the 1st couple of go arounds I
sort of move on. If someone really wanted to, you should be able
to even do stuff like a micro dos that just jumps through $2E0 or
$2E2 when the DL has finished or for that matter, transfers disk
images from the IBM to a real 810/1050. IMO: Stuff like the SIO2PC
is so superior of a hack it makes me feel humbled. The only advantage
the joystick method has is it only uses one diode & on resistor.
Rick

7735. Re: 8bit <-> ST Transfer

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-23 18:40:26 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <129869@cup.portal.com>
Source record: 95964

Richard; I'm not sure if I replied to this before, Portal's been expanding
so things don't always go that smooth. If you can get XFormer 2.55, the
ST version of the 8 bit emulator, it will do 1/2 of what you want.
As far as using the ST as an 8 bit drive or RS232 server, I'd say if
your willing to make a SIO2PC cable & write the software I'd virtually
garratee success. I know of someone who has done just that on another
platform using C with some assembly on a non-[ST, IBM]. Actually I have
to take some of that back, the ST only has one serial port so you could
use it for a printer/buffer. You'd be supprised at how vanilla the output
from the Atari serial cable is once you invert it. Everything goes just
like it says in the technical refs. Sends out something like ASCII
with a couple of control bytes. I haven't fooled with it for a while, but
something like trying to read a directory of a non-existant drive with
a term program lurking on a SIO2PC gives a series of bytes that show
up on the screen something like:
<unprintable>1<unprintable character 31>S<checksum>
& repeats it 5 or six times for. This is just DOS asking for drive #1,
the ASCII 1 followed by the #31, for it's status, "S", followed by
a checksum. It retries the status command about 5 times before giving
up. The rest of the commands for reading/writting sectors follow a
similar pattern.

Source record: 95965

Ivo; if you're just collecting designs, I've done this with a 74ls164 serial to parallel converter with one pin as data, one as clock, & one to strobe the printer. I never wrote a true handler for it though, just a simple USR() to handle the dirty work. If you look at the data sheet for the 74ls164, the design is obvious.

Message-ID: <129873@cup.portal.com>
Source record: 95966

Richard; I want you to know that I do care & applaud your efforts.
The 'but' of the situation is I don't really play that type of game
on my Atari anymore. I use my Atari as a hobby for programming & mild
soldering. Also, every one of my kids & nephews/nieces is either into
IBM, SNES, Sega. My total game software purchases in the last year
reflect this, Ultima 7 for $11, EOB II for $14.95, Street Fighter II &
a couple of other titles I can't remember for the consol games. In
all honesty, I can't think of any software that could come out for
the Atari that I would feel compelled to buy. Hardware may be a different
story if it was an enhancement of capability, but even that is resticted
by what I need. We're still suffering from the imploading market where
people are dumping stuff. I used to go to San Jose Computer & go through
their BOXES of used 8 bit software, any title $1. Now SJC is no more so
you won't have to compete with at least quite as many low ballers.
I can't even suggest software I'd buy for the 8 bit if it was available.
I had a scanner given to me for my IBM, it was bundled with drawing
& desktop publishing software. My CAD program was IBM freeware. Let's
see: Any software that's [games, WP/Desktop publishing, Spreadsheet,
telecomunication] I pretty much have covered. This is why I'm a fan
of new hardware. I know there is the cart/horse thing for application
software vs yet another ramdisk, but assuming I could afford things
like a MiniIO or Sweet 16, then I would be willing to purchase
software like a bbs for the 8 bit.

I have the game somewhere in my large collection or 380+ disks. I have to
use FIX XL/XE to use it though. I don't know who made it, but I think it
was the same person that made Hard Hat Mack.

=CB=

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

7739. 800XL parallel bus ->ACIA

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-23 22:18:12 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELYJEIWCUp@stingray.manawatu.gen.nz>
Source record: 95967

Has anyone ever come up with a circuit that connects to the 800XL parallel bus that has an ACIA (serial) and a baud rate generator, dipswitches (ofcourse) and anything else that I haven't thought of (my electronics exp. is not 100%).

I looked at 1090xl.arc which was suggested to me, but that doesn't have any e.g. circuits and I'd rather not blow my soon-to-be-acquired replacement 800XL by forgetting to put a resistor across something or other.

I don't think that it should be too hard to do, and then it wouldn't get in the way like a joystick port circuit would, and it would be less hassle to write a handler for than an SIO circuit (I think).

I'm just tossing around ideas and sorry if you have all heard this over the past 14 years or so.

Thanks,
Richard =8-]

Hmm. Mail is a possibility. A kind of closed local BBS. Either the page gets through (the guy is in DOS) or it gets redirected to Email so the user then gets a YOU HAVE NEW MAIL msg when he drops back, or he can check manually.

That I can see. Because if the other guy is playing a cart game and is totally inaccessible to any form of pipe handshaking, the write program can error out and redirect it to a file. Since both slaves are using a common drive, the other slave will then pick off the mail. The only kind of handler you'd need would be during DOS. Hopefully it wouldn't wipe out software compatibility.

I just don't think you'd likely wind up in chat too often.

If you are both in the same house, Email is kinda pointless ;)

: to the minimum that not all 5.25" drives will work in it.

I've had bad experienced with my XF551 oer the past 2 years. The Mechanism
is perfectly fne, but the original circuit board is quite hacked apart. :)
Something with the power supply unit of the mother board not working for
over 1 minute. (Most likely a blown voltage regulator and maybe a few
caps)
What I have done would make most people cringe -- I completely
desoldered and removed all the electronics associated with the
power supply unit of the board. What I will try next is getting
a power supply unit which provides the +5V, +12V and GND via
those nice 4 pin connectors. Looking at the motherboard, all that is needed
for the circuitry is the GND and +5v, the mechanism however needs
GND, +5V and +12V. For most floppy drive suuply units (the kind found
in PC compatible) they have 2 4pin connectors. I will simply plug
in the mech into one of the supply plugs, and then plug the board
into the other supply plug. If all goes right, I will have an Xf551
up and running again w/o ever worrying about Power Supply problems. :)
All I need is some confirmation as to what the actual circuit board
takes. ie: voltage and ampage ratings would be crucial (for the circuit
board at least)
So could those of you with a properly working XF551 measure
the voltages and other ratings that it provides on the 4 pin
connector to the mechanism?

Thanks,
--BRiT

Note: I do have a new Xf551 controler board on loan from a friend.

BTW: I was quite frustrated with the XF551 controller board, and
I feel it got its just rewards. (grin)

7744. Mac emulator?

Well, the holidays have got this 10-year-long Atari 8-bitter, who switched to Mac 2 years ago, feeling rather nostalgic. Not just for old holiday shows and music, and childhood toys (ie-Lionel trains), but also for his first computer addiction-the old Atari 800. I know that 2-3 years ago, a friend had an Atari 8-bit emulator on his ST. I recall hearing that someone was making one for the PC. Did anyone make an Atari800 emulator for the Mac?

It would have been much easier if you had bought a transformer/converter (220V -> 110V) at your local electronic store :). Prices vary from $30 - $50. I also sell the BB here in Germany and had the same "problem". Sure, transformers are expensive, but they are (IMHO) the SAFEST solution to this problem :) !

In a message dated 12-21-94, Glenn Saunders said:

"I find this ironic because although computers rarely
use NTSC signals these days, high profile videogames
machines like 3D0 and Jaguar as well as every new
console probably, has RGB output as well as split and
composite video."

The question is, however, how many gamers fit in the high end bracket that are both aware their machine can output analog RGB, and secondly, are willing to track down and/or make the cable necessary to hook it up? If this aspect were "pushed" more by the game unit manufacturers and/or game magazines, perhaps this could create sufficient demand for RGB-capable monitors to encourage some company (i.e., Magnavox) to restart production of their discontinued 15.75Khz RGB monitors (i.e., the 1CM135), and/or for TV/monitor manufacturers to add RGB analog input to some monitors.

BTW, getting a bit off track here, but in an issue of Video magazine a few issues ago, they reviewed a very nice (but relatively expensive... about $4000) LCD video projector that accepted RGB input. Mention the prospect of playing AvP on a 100" screen to a die-hard Jaguar gamer, and I expect they might lose control of all bodily functions! <GRIN>

"...this problem does not exist in Europe because almost
all modern televisions, no matter what price they are, have
things called SCART connections which support RGB."

Amen to that! In fact, since the PAL versions of many TV sets share many of the same components of their NTSC cousins, what, aside from penny-shaving, stops manufacturers from adding SCART inputs to US sets?

In fact, on the 25" G.E. (which is actually manufactured by Thomson), which I purchased a few days ago, the rear panel has a rectangular area the size of a SCART connector, evidence that the same back panel is used on a set with one (and likely the same front, tube, and likely all most of the chassis, excepting the tuner and power supply). Likewise, there are less expensive versions of this set that lack the S-video input that have a round area where mine has the S-video input jack.

I am tempted to go inside after the warranty expires (a year from now on everything but the tube), and see if by chance the only thing missing as regards a SCART connector is perhaps only the connector itself, or perhaps that plus a few inexpensive discrete components.

Having a 25" RGB monitor, if only capable of "low res", would be very nice. (However, the set advertises 400 lines res, and, if is some have argued, lines = 2x in pixels, 80 columns should be easily achievable with an RGB analog hookup). Too bad TV's never state the dot pitch values of their tubes!

"I see no reason why split video should be relegated to
>700 dollar monitors or that RGB shouldn't be supported
at all. It doesn't take THAT much more expensive electronics
to add Y/C and RGB ports."

Split video is primarily used by folks with "high-end" gear such as laser disc players, S-Video and Hi-8 VCR's, and some satellite recievers. I imagine set manufacturers do not even take S-video capable computers (such as the Atari and Commodore 8-bits) and game consoles (such as the Jaguar and Amiga CD-32) into the equation.

Certainly RGB analog should not cost that much to add, as all TV's end up with RGB analog signals in the end. After all, the picture tube would not know what to do with a composite or even split video input if it jumped up and bit it on the cathode <grin>, but it understands analog RGB just fine.

At least not *all* TV/monitors with S-video cost $700 or more. My GE 25GT542 cost only $317.60 + tax. The next closest model I found in price was a JVC 26", which was more expensive, and lacked the picture in picture feature my G.E. model has. I have yet to rig up an S-video cable to hook up either my Atari or Commodore computers to it, but thus far, I have been very impressed with its performance.

BTW, does anyone know of an inexpensive source (i.e. less than $20) of cables that have an S-video plug on one end and dual inline RCA jacks on the other? This would allow me to use the standard monitor cables I have for my C-128 and two 8-bit Atari's, rather than having to make new monitor cables for each, and would also allow me to use one of my standard RCA switchboxes if I wished to have both hooked up.

7749. Re: 'Util' and file corruption

Source record: 95976

Once again, I don't claim to be a 'C wennie, but after looking at
the routine that parses the command line, I don't care what the
doc's say. There are enough mistakes in the code, functions & variables
that are never reached, etcetera that I don't really have a super amount
of faith in the docs.It looks like Marslett just knocked it out in an
afternoon. Some of the stuff he's did in it was, well I don't see the
need for it. OK: IF I was using a multitasking computer I could call up
my WP & have a copy of the code in the window, but actually the term program
I used to use before I went to 14k would have let me do this also<g>. As
such this is from memory. If you want to look at the parser & draw your
own conclusions, this is how you do it. BTW: Anybody that wants to, jump
in to correct me as there's bound to be a mistake or two.
All MS DOS computers have two parameters that are passed to C on the
command line; [argc, argv] argc=>number of arguments argv=>pointers to
arguments. I can't recall, but I think argc always starts at '1 &
argv starts at zero so:
UTIL foo bar
Would have argc=3, argv[0]="UTIL", argv[1]="foo", argv[2]="bar"
What Charles did was equate a pointer to the argv so it points
to the start of the parameters passed by DOS, i.e. argv[1]. The
parsing just checks checks for one escape character [-, /] and
figures out what the switch is by incrementing the pointer one
character at a time at argv[1]. When this is done, it goes to
argv[3] but doesn't check for the escape character, just the command.
so inorder to get the command into the argv[2] slot, you have to
have a delimiter that DOS understands i.e. a space so "-b w" works,
"-bw" shouldn't. Understand that my references to argv are pointed
to by Charles, I'm just using argv[x] because it's a little clearer
to me. Whoops! just noticed I said argv[3] above when I meant argv[2].
Anyway, you're welcome wade through the code yourself & tell me what
you think is happening. I haven't looked at it in a while so I could
be off, it's just I don't think so right now.
Rick

First off, I don't know why Atari left a rather ugly nub on the end of their Jaguars instead of a formal port bay. So I do expect future consoles to have more standardized ports.

The trend has already been going towards better quality signals. First everything only had RF. Then with the mid 80s 8-bits, a video and audio out jack (composite) was routinely supported since finally TVs were supporting composite inputs more frequently with the proliferation of VCRs.

Today, with people so used to VGA resolutions, it is becoming harder for console programmers to shy away from full NTSC reslutions (640x480 plus overscan). I've played AvP on RF. IT LOOKED LIKE SHIT! People will move to better signals if they get fed up with smeared artifacted pictures.

It's a case of whether you feel people should want it before it is available or whether you should make it available and that generates the market.

Split video is good, but RGB is the only way to get maximum clarity at full NTSC rez.

I think anyone who makes a nice bigscreen TV that is essentially like an oversized 1084S is going to do quite well for themselves next fall when all the new consoles come out.

Aside from penny-shaving? Probably nothing at all.
They figure, why pay to put a piece on when nothing here can connect
to it. If just a few manufacturers of both displays and input devices
(VCRs, disc players, game machines) would put them on here, it wouldn't
take long for it to become a standard feature here as well.

You could probably just pick off some well-marked points on a circuit board,
if you're lucky.

>of cables that have an S-video plug on one end and dual inline RCA jacks

I've never seen such a cable, but if you can find a cheap S-video cable,
you could cut off one end and put on your own RCA connectors.

7755. Identify this Kraft Trackball

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-25 22:41:14 UTC
From: gkomatsu@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D1E1or.F26@news.hawaii.edu>
Source record: 95982
Cross-posted to: rec.games.video.classic,comp.sys.atari.st,comp.sys.amiga.misc,comp.sys.atari.8bit,comp.sys.cbm

[sorry, for all the crossposting, but I'm trying all possibilities
suggested by this trackball...]

A long while back I picked up a Kraft Trackball in a trade
It's just the unit, no box, manual, etc... And there's a bunch of things
about it which I'm wondering about.

It's grey in color except for a single cornstarch blue button.
It's more or less wedge shaped (more like a fancy looking futon shape
from the side. =^) ball in the middle, three buttons along the bottom.
At the top is the blue button which I've determined to be a "drag" button
(it puts out a button-down signal when set) and above it is a switch
marked AF--D. At the top side, next to the cable is a 6-pin telephone
style jack which only uses the two middle pins, on the side is a 3 position
switch which determines it's function, identified by a label on the
underside:

```
_____________________________________________
| |
| COMMODORE 64/128 |
| ATARI ST AMIGA ATARI 400-1200 |
| MOUSE 1 2 3 |
| JOYSTK 3 3 3 | ("JOYSTK" is actually
| | printed as so)
| M A D E I N T A I W A N |
| M A N U F A C T U R E D B Y K R A F T |
|_____________________________________________|
```

Outside of the "Kraft", there's no indication of model number
or such. Anyone?
Main questions I have though are, what is the phone-jack for
and what does the AF--D switch do?

The trackball looks like this...

Message-ID: <xcyXvxu.ransom22@delphi.com>
Source record: 95987

The Atari computers are not alone in their status as orphaned computers which retain a dedicated followig of users. The Apple][, Commodore 64/128, TI 99/4a, Coleco Adam and Timex/Sinclair each enjoy continued popularity among a grup of users even now, long after all formal support of each has been dropped by their respective manufacturers.

What causes this phenominon? We have explored this issue in the micro-cosm of our own well loved computer, the ATari 8-bit. The answers we came up with were varied and numerous, but the one that most of us agreed upon was that using these compuers is a peasureful thing. Might that not also be true of the wider community of classic computer users?

If this is so, then perhaps the market research firms and others who are paid to know intimately the prospective buyer have missed something entirely: people who enjoy using a particular computer will stay with that computer so long as it does for them what they require. Often, they will go so far as to modify the computer so that it can perform new tasks that are needed as time goes on.

To be sure, the number of people who do so is small. Of the numerous owners of Atari 400/800/XL/XE's and Commodore 64/128's, how many are left? Yet, looked at another way, out of the relatively small number of Timex/Sinclair and Coleco Adam users, there are still enough left to keep a forum going on CompuServe.

If we were to spend the time and money necessary to do the research, we would come up with a specific percentage of users that stay with an abandoned platform. Perhaps we might find that .2% of all users do so.

When one is speaing of Coleco Adams or even Atari's, that comes to a paltry number of people. Certanly not enough to matter to the large, powerful (or formerly so) companies that made the machines.

Now consider for a moment the number of people who use the MS-DOS environment. Industry pundits forsee that platform being dropped completely within one or two years. How many users will not move on? If it is the same .2%, we are talkin about a large community.

Further, if Windows is dropped, as some analysts predict, in favor of Windows NT, will therenot be an even larger number of users who reman in the "old, outdated" world they know rather than moving on to the brave new world offered by Microsoft?

Finally, if Apple moves its support entirely to the PowerPC line, won't there be a sizeable population of Macintosh users left behind?

Add in the users who will stick by the Amiga, and you have a huge total number of people using outdated and obsolte computing platforms. All of these people willbe lost entirely to the mainstream computer manufacturers, distributers and retailers.

"Ah," the manufacturers say, "but there will always be new people to sell to. The home market is still largely untapped. And new computer users are born every day!" To that I say that there will also always be more platforms dropped, and thus more users lost.

Wouldn't it be better to tape these markets you've abandoned over the years? Sure, we aren't the big pie that the mainstream market could be thought of as. But there, you are only getting a very,very thin slice of a big pie. Wouldn't it be nice to get a really huge slice of a small pie? Your staff of previously trained developers could certainly create thorougly wonderful products that would meet the changing needs of these heretofore orphaned users. And, with virtually no competition, you woul be able to attain a marketshare that would be the envy of any industry. Finally, this attention paid to loyal customers would engender good will toward your company that will, in time, bring larger benefits such as free advertising (word-of-mouth) and potential conversion of die-hards to upgraders.

Perhaps someday the companies will realize that scorning those who brought them the success they enjoy is not good business practice. That day is not yet at hand, but perhaps someday . . .

-Joe

Even the most virile MS-DOS/Windows advocates will celebrate the day those packages are put out to pasture as legacy sections of future OSs and emulations of OSs, which will be soon.

Noone will purposefully limit themselves to ancient IBM software, or even newer versions of DOS/Windows if there is a better alternative out there.

The comparison of orphandom between the 8-bit age and the 16/32 bit age is not really there.

Few if any 8-bit machines can be truly accellerated without causing major hassles, or at all. The reason we have seen the x86 and 68K series last as long as they have has been the fact that faster and more efficient processors have been released and the archetectures have been able to accept the new CPUs rather easily. For instance, a 1987 Amiga 500 can very well have an 040 expansion in it. This is different from a 1979 Atari 800 still running lazily at 1.79 mhz in 1987.

Up until now it has been far easier (although not always practical) to make older 16/32 bit machines relevant for longer periods of time.

Not only that, I don't see how any kind of fanatacism can develop over any particular clone. What makes one clone that much more unique and loveable than another? I can imagine the IBM PC Jr. has its fanatics. It has quirks which some call supid incompatibilities, and other call loveable uniqueness. But what else?

The Atari ST and Amigas are both of a different breed, so it is natural that they would develop an anti-establishmentarian niche.

Unique computer archetectures and small and unpopular ones go hand in hand. At least until now they have. You see not many people have taste ;)

Even the Amiga desktop machines, the 2, 3, and 4K are as different inside from a clone as an Atari 8-bit is different from an Apple II box--despite what it might look like from the outside. Obviously Atari's and CBMs anachronistic but loveable devotion to continuing to produce CONSOLE home computers is another factor of their uniqueness.

Orphan computer usage I think is similar to other forms of nostalgia. It's both nostalgia and a king of computer ascetism (for those with only 8-bit machines that is). Something can't just be old, it has to have uniqueness compared to its peers and/or its present day counterparts. Otherwise there is little attraction to old computers. This is why I never got into either the Apple II or CP/M computers. CP/M is exceedingly bland and businesslike with its lack of graphics. The Apple II has very primitive graphics and sound and is therefore equally bland and boring to

me.

I simply would not have kept on using my Atari as my sole machine as long as I did had it been a rather boring and utilitarian 1.79mhz 8-bit machine.

I would not have been able to withstand the lure of the amazing graphics and sound of newer machines as long as I did had the Atari8 not been able to amuse me with seemingly neverending feats transcending my known conception of its limitations. Yet even then, it was a form of forced ascetism to me because of how computers had improved remarkably in the last decade that as great as the Atari8 is at what it sets out to accomplish, far greater glories lie at ones reach, at least these days the way the wheels move in the used market to lower better and better computers down to truly affordable levels. Computers which are far more competent in all but their basest forms, and can be upgraded to be competetive even in today's market.

In that list of GUI's for PC's, you forgot DesqView, which I would consider if I could find a copy for low and if it works on this old crappy 8086 or whatever it is... It is one of the few MULTITASKING environments for PC's. Even Windows isn't as good as, say, OS/2 (so I've heard) when it comes to that. Of course... I've seen the OS/2 WARP commercial, and they NEVER ONCE show the screen. I've seen a demo (I think!?) of OS/2 running on some PC at my school, and it looked pretty horrible (bad graphics, VERY slow, slow screen writes, etc. Coulda been a crappy PC though...)

I have a copy (somewhere) of a BASIC/ML BurgerTime clone written by some fellow who also was working on a Ghosts 'N Goblins game. If I remember correctly (which I probably don't!), the BT clone was completed. The GNG one however was incomplete, but pretty nicely done. Unfortunately, the GNG clone sucked in that it was an IMPOSSIBLE GAME! (Oh wait.. let me rephrase that; GNG ITSELF sucks because it's an IMPOSSIBLE GAME! :))

I know where my copy of the GNG clone is... now that I think of it, I may have lost my copy of the BT clone on some bad disk or something.. I might be able to find it again on a BBS around here (where I probably got it)

later!

Glenn, I agree with you doubly.. First off, especially from seeing 2.0 and 2.5 versions of PC Xformer, how could anyone think the 3.0 version would be perfect! :) That's why there will be FUTURE VERSIONS! :) And secondly, as you said.. it makes one feel kinda smug that even a Pentium can't emulate an Atari 8-bit perfectly...

BUT, on the other hand, what Darek HAS done is INCREDIBLE! Of course, he's modest and says "well, all that's handled by the OS.. I stuck it in and it worked", and of course he's true, but he doesn't seem to brag too much about how he got ANTIC, POKEY, etc. working! :)

I think perhaps better descriptions, and/or demo versions of the games, and/
or screen-shots of the games may taunt us more towards buying software from
you (OR ANYONE!). I have a collection of KE-Soft games in demo-versions,
and rarely play any of them. They're really neat games, and I like them,
but they're all a bit TOO puzzley for my tastes! (Dredis is a pain in the
ass and is only two levels long, and besides I have about 12 OTHER Tetris
clones for my 8-bit, including 2 or 3 of my OWN! Actually, I take that back,
there are two games I was slightly interested in, but they seemed like
very simplified versions of modern games; Fred and some army game. But..
still, there was quite a collection of puzzlers.(

Anyways... I AM a bit interested in the Golf Tour '94/95 game... BUT
I WOULD LIKE TO SEE WHAT IT LOOKS LIKE FIRST! :)

And, to reiterate what others have said; sending cash overseas is not
what us Americans are used to! :)

>emulations of OSs, which will be soon.
>
>Noone will purposefully limit themselves to ancient IBM software, or even
>newer versions of DOS/Windows if there is a better alternative out there.

"better" is a relative term. :) I know several people who
much prefer MS-DOs's command line to the GUI interface. Sure, if something
comes along that they see as being "better", then they will switch.
But I don't see that happening for those who prefer command line over
GUI.

>The comparison of orphandom between the 8-bit age and the 16/32 bit age is
>not really there.

Not in the sense of the computers,which I didn't discuss being
changed vis a vis the IBM world. Rather, I was speaking of the OS or
overall platform changing, ie MS-DOS and Windows to NT (or even OS/2).
Certainly it is true that few, if any, bemoan the increasing
processor speed or the new sound cards available for those machines.
But again, there are those who prefer MS-DOs to a GUI.
It is those MS-DOS lovers that I was writing about in the original
post.

>Not only that, I don't see how any kind of fanatacism can develop over
>any particular clone. What makes one clone that much more unique and
>loveable than another? I can imagine the IBM PC Jr. has its fanatics.
>It has quirks which some call supid incompatibilities, and other call
>loveable uniqueness. But what else?

Again, it isn't the archetecture in the 80x86 world that people
grow attached to, it is the environment.

>Unique computer archetectures and small and unpopular ones go hand in
>hand. At least until now they have. You see not many people have taste ;)

Well, yes, that is a truism that unique archetecturs and unpopularity
go hand in hand. If they were popular, they would no longer be unique.
There is nothing inherent in the ST/Amiga archetecture that makes it
more "unique" than the IBM archetecture. One got popular, the other
did not. So, we say that the ST is unique and unpopular, while the
MS-DOS boxes are "common" or "standard" and popular.

>Even the Amiga desktop machines, the 2, 3, and 4K are as different inside
>from a clone as an Atari 8-bit is different from an Apple II box--despite
>what it might look like from the outside. Obviously Atari's and CBMs
>anachronistic but loveable devotion to continuing to produce CONSOLE home
>computers is another factor of their uniqueness.

True. The console-style computers lost all popularity in the 1980's.
Yet, Atari and CBM continued to produce them. Was there not an Amiga
that accepted expansion cards, tho? Was there an ST or TT that did that?
I'm not sure that I am remembering that right...

>Orphan computer usage I think is similar to other forms of nostalgia.
>It's both nostalgia and a king of computer ascetism (for those with only
>8-bit machines that is). Something can't just be old, it has to have

>never got into either the Apple II or CP/M computers. CP/M is exceedingly
>bland and businesslike with its lack of graphics. The Apple II has very
>primitive graphics and sound and is therefore equally bland and boring to
>me.

Absolutely. If Atari's ST had been simply a faster 8-bit (perhaps
the entire archetecture of an XL built-in, or better still a new
processor and group of LSI chips that were a superset of those used in
the 8-bit, with all the functionality of the XL plus more graphics modes,
sound range and # of voices, speed, larger address space from being a
16-bit machine, etc.) then we would have next to no "classic 8-bit"
users around.
There was a paradigm shift from the 8-bit to 16-bit computrs
that hasn't happened again since. Apple, Atari and COmmodore each
completely redesigned their computers in such a way that it required
users to buy the computer, peripherals and software all at once in
order to "upgrade". Too bad they didn't retain compatability.

>I simply would not have kept on using my Atari as my sole machine as long
>as I did had it been a rather boring and utilitarian 1.79mhz 8-bit machine.

I can't imagine developing a long-term attachment with a display-
writer. :) You hit the nail on the head again with that one. I had
been trying to figure out what it was that gave the Atari its special
place in my heart, since at the time I returned to the 8-bit I had use
er, used the Atari for 3 years (my first computer), the Apple //c for
five years, and an IBM for one year. Why not the Apple //c, since I
spent most of my computing time on it? Was it just because it was
the first?
I am certain you are correct, at leat in my case. The Atari's
graphics and sound are what brought me back, and kept the computer in
my heart through the years.

>I would not have been able to withstand the lure of the amazing graphics
>and sound of newer machines as long as I did had the Atari8 not been able
>to amuse me with seemingly neverending feats transcending my known

>the way the wheels move in the used market to lower better and better
>computers down to truly affordable levels. Computers which are far more
>competent in all but their basest forms, and can be upgraded to be
>competetive even in today's market.

Oh, I watch my SO use CorelDRAW on our '486, and I'm amazed.
Not only does it utilize the tremendous graphics capabilities of that
machine, but the program itself is extremely powerful. A good artist
such as she is can really turn out some amazing stuff. The very best
Paint programs for the Atari8 just can't compete.
yet, I am no artist, so the Atari8 is fine for me. :)

Excellent reply, by the way.

-Joe

Hmmm. DesqView isn't a GUI, is it? i use it, and find it
to be completely lacking of Graphics. It is text-based. However, it is
a multitasking environment. But I think GUI (Graphical User Interface)
really requires graphics rather than text...does it not?

As for the price, at $129 it *is* pretty steep. But I haven't
found a better environment to run my BBS under....

I have a question. It seems c.s.a.8. is being used for quasi-commercial purposed. These LARGE auction/for sales are becoming more frequent. J. King said he was putting one fellow in his Killfile, but I thought that was just to kill incoming e-mail. B. Kok asks if others dislike these massive for sale/auction posts. I do. And I think it is against Internet policy to use internet for commercial purposes, which is waht these people are doing. It may take some help from people more knowledgable about internet and usenet, but we could sure use some help getting rid of these pests.

7778. Wanted: Atari Demopacs

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-27 02:26:37 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <psyVPl9.ransom22@delphi.com>
Source record: 95858

I would like to own all the Atari DEMOPACs. They produced at
least eight of them. I own #2,4,5. I am looking for #1,3,6,7 and 8.
Would also like to have the errata/tip sheets they produced for
the Assembler/Editor, PILOT, Atariwriter,Macro Assembler, Basic Ref.
Manual, CX-85, 410, Speed Reading and Touch Typing.
Photocopies are fine, if that is legal. :)

E-Mail me if you can help me get these.

Thanks,

Joe

>maybe there are also people that has to PAY for there mail...
>So let me know if you also like to see that he stop with his Selling list
>in the comp.sys.atari.8bit area......

I'm with you! Luckily I use threaded newsreaders that don't force me to
download every article, so I can easily ignore those posts. I still
think they should not be posted.

>I have also try to open his eyes so I have send him back 2 of his lists but
>he go's on....

That wouldn't do any good -- since he's using the Cleveland Freenet, he's
insulated from troubles like long messages. He doesn't pay for them, and
he doesn't have to download them.

>So hope to hear from ALL of you who also DON'T like his list...
>
>> Send all bids to: dw901@cleveland.freenet.edu

7781. SIO2PC or 850 Interface?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-27 05:11:43 UTC
From: joneil@infi.net
Message-ID: <3do7mf$g5b@lucy.infi.net>
Source record: 95860

I was just about to round up the parts I need to build the
SIO2PC cable when I stumbled on a great find. The local surplus
shop had the SIO cable I needed as well as a box containing
an Atari 800, 850 interface, 2 power supplies, a box of cartridges
and various joysticks! $35 Bucks!!

So my question is: Can I use the SIO2PC software with the 850
instead of building the cable?

If so, what type of serial cable will I need to use?
Null modem or straight DB9M-DB9F?

I need all the disk functions (including boot) of the SIO2PC
software as I have no Atari drive of any kind.

Help?

Easy -- all letters are rotated by 13 letters, so "A" changes to "N", "B"
changes to "O", and so on.... "M" changes to "Z", and "N" changes to "A".
It's a basic Caesar cipher that is self-inverting.
The key:
ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz
NOPQRSTUVWXYZABCDEFGHIJKLMnopqrstuvwxyzabcdefghijklm

Non-alphabetic characters remain unchanged.

Source record: 95864

Hi y'all!

I was just wandering if Doug Neubauer still did stuff for Atari, since he has credit for working on thier games at least through 1988. Since he is the progenator of the Star Raiders series, I was wondering if he might be doing (or might be contracted to do) the rumored Jaguar port, 'Star Raiders 2000'. I know this is a long shot, but does anybody know? (This is a game I *REALLY* want... I still play the 8 bit!! :)

(If possible, please send responses to me... I'll probably miss them otherwise... Thanks!)

Much Much Much Much Much Much Thanks,
rex

There is no reason a gui and a shell can't coexist. It does in AmigaDOS
and also with Unix/X (and please no semantics about how X isn't a GUI).
If the developers fail to provide a cli fallback that is their own loss.

I am not familiar enough with the newer OSs to know whether they have
this or not. Command.com is something like 50-60K which is miniscule for
32-bit computers. Shells are not hugely difficult to write especially
since so many mimick the others and so there is very little innovation
necessary.

Doug's last game was Radar Lock in 1989.

Star Raiders 2K is, at best, a half-shelved project at Atari. For some reason they think things like 3D spacewar and yet another port of Defender are more important than reclaiming the 3D space fighter genre.

Traditional Tramiel-think. And I too was all excited and ready to put away my hatred of the Tramiels when I heard about this. I knew it was too good to be true. If it DOES come out, don't expect them to do with it what they should do... As good as SR is, it needs capital ships and a more graphic docking sequence and maybe some way to represent a cubic galactic map as well as support for ALL axes of movement. Tramiel Atari was more than willing to slap on the name of Star Raiders to a game which didn't deserve the name, so I am not holding my breath that SR2K, if it comes out, will be worthy.

To anyone who has a problem with Mike Novak posting his obscenely long
forsale lists every day, I ENCOURAGE YOU TO SEND YOUR COMPLAINTS TO
postmaster@cleveland.freenet.edu as well as the address listed above.

Mike Novak has been asked to stop posting his lists by LOTS of people, at least
10 I have personally had contact with, though he claims 'to have had
NO complaints'.

He is already in (well deserved) hot water at Cleveland Freenet for
a number of things, including mailbombing people with his listing (sending
3-4 copies to people who ask him to stop).

When Mike started posting his 'MASSIVE AUCTIONS', I explained to him that
a large # of people PAY FOR ACCESS/E-MAIL/USENET time/space, and that
sending out cancel messages does no help the thousands of people who
read USENET/MAIL offline and have to download it 2-3 times (crossposting)
everytime he posts it. Not that he ever canceled most of them anyway.

Not to mention filled disk quotas, money wasted
for pay service subscribers downloading this junk, local telephone time,
etc. He has made it quite clear that he cares about nothing but making
money, and everyone else can just swallow it.

He contibutes little or (usually) nothing to the groups he inappropriatly
cross-posts to, except his 'MASSIVE AUCTIONS'.

This has gone on quite lone enough, this assult on c.s.a.8 recently is
nothing compared to the spam he dumps on groups like rec.games.video.classic

and its variants.

Address any complaints to these addresses: postmaster@cleveland.freenet.edu
root@cleveland.freenet.edu
xx998@cleveland.freenet.edu

I don't think the SIO2PC software will work with an 850. And, by the way, the 850's 9-pin serial ports have a different pinout from IBM's, so neither a plain nor a null-modem 9-pin cable would work.

>naina@technet.sg

ilDamn! That's just what I am designing at this very moment! Well, you may
ilemail me the schematic. Let's see how much is the same :-)

Just a minute here. This device sounds like a SuperFACE printer interface
that has been around since about 1983. It comes with a special version of
SuperMON called PrintMON. It Has a printer handler to handle the one on
joyport 2, in roms. The fact it is also a hardware translator is beside the
point. Please send the code and schematic and i will check it out. There may
be copyright on this which i hold.

Source record: 95875

RlOne last bit of kibble. Have you guys tried adjusting the speed of the
Rl1050 to 300 RPM before formating/writing the disk used in the transfer?
RlIf you want to give this a go, just run a disk RPM test while adjusting
RlVR2 on the 1050. There may be a problem with the IBM trying to center
Rlon data, ergo it's gets the first part of the data, but the 288 RPM
Rldata of the 1050 gets out of sync. The resistor is located
Rl**********
Rl* *
Rl* x *
Rl* *
Rl* *
Rl* *
Rl* *
Rl**********
Rl FRONT

I don't think this will help. The 810/1050 are set at 288 because of the
processer/sio speed of the drive. The XF551 uses a standard drive mech which
is set to 300 rpm yet it can read/write 810/1050 disks fine. A happy 1050
can read/write 180k ms dos disks. So the problems are nothing to do with the
drive rpm.

Actually, a schematic is the easiest thing for me to do. The circuit board is about 2nd, but a finished prototype is like pulling teeth. A foil pattern for a pc board isn't that hard to get out since I *think* my cad software will output a postscript file. BTW: By circuit board I meant the design, not an actual board. I guess what I'm saying is if you have friends that will do the building of a prototype board from a schematic, do whatever it takes to keep them happy! It is extremely tedious work. I can do designs in a matter of days, but when the green flag drops & it's time to build the circuit I seldom have the month of weekends it takes to build it. I also don't have the money it takes to have the boards done by a shop.

7798. Using Usenet for advertising (Policy statements)

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-27 17:56:29 UTC
From: mcurrent@blue.weeg.uiowa.edu
Message-ID: <3dpkgd$2n4b@blue.weeg.uiowa.edu>
Source record: 95877

Someone (Russ I believe) asked about the rules for postings commercial ads on Usenet. The thing about Usenet is, with no central body to rule over the system, there really can be no "official" rules. Every local system administrator can do or permit whatever s/he wishes.

However, to make the whole system work, system administrators and their users have to cooperate by following some guidelines. What follows are excerpts from the FAQ "What Is Usenet?", and the FAQ "What Is Usenet?, A Second Opinion". After just a few minutes of searching, this was the best I could find. Let me know if you found this interesting. -Michael

\/\/\/\/\/
7. Usenet is not an advertising medium.

Because of Usenet's roots in academia, and because Usenet depends so heavily on cooperation (sometimes among competitors), custom dictates that advertising be kept to a minimum. It is tolerated if it is infrequent, informative, and low-hype.

The "comp.newprod" newsgroup is NOT an exception to this rule: product announcements are screened by a moderator in an attempt to keep the hype-to-information ratio in check.

If you must engage in flackery for your company, use the "biz" hierarchy, which is explicitly "advertising-allowed", and which (like all of Usenet) is carried only by those sites that want it.

\/\/\/\/
> 7. Usenet is not an advertising medium.

A man walks into a crowded theater and shouts, "ANYBODY WANT TO BUY A CAR?" The crowd stands up and shouts back, "WRONG THEATER!"

Ever since the first dinette set for sale in New Jersey was advertised around the world, people have been using Usenet for personal and for corporate gain. If you're careful about it and don't make people mad, Usenet can be an effective means of letting the world know about things which you find valuable. But take care...

- Marketing hype will be flamed immediately. If you need to post a press release, edit it first.
- Speak nice of your competitors. If your product is better than theirs, don't say theirs is "brain damaged", "broken", or "worthless". After all someone else might have the same opinion of your product.
- Dance around the issue. Post relevant information (like price, availability and features) but make sure you don't send everything out. If someone wants the hard sell let them request it from you by e-mail.

- Don't be an idiot. If you sell toasters for a living, don't spout off in net.breadcrumbs about an international conspiracy to poison pigeons orchestrated by the secret Usenet Cabal; toaster-buyers will get word of your reputation for idiocy and avoid your toasters even if they are the best in the market.
- Disclaimers are worthless. If you post from foobar.com, and put a note on the bottom "not the opinions of foobar inc.,", you may satisfy the lawyers but your corporate reputation still will be affected. To maintain a separate net.identity, post from a different site.

It's best to just think of SIO2PC as converting your clone into
an Atari Disk Drive. You could still use the 850 while the SIO2PC is
plugged in, but only as a straight 850. You can easily build a
SIO2PC cable for less then $10 so unless you need to run copy protected
software <no small matter> it's the cheapest way to get a disk drive.

It was probably me. Someone in the local user group, BAAUG, went by the
store & said it had been vacated. The word was Mark <Is that his name?>
was going to try to do some mail order out of his house in Morgan Hill.
No data on if the mail order thing has happened. As a store on Alma Ct.
it is no more, as a mail order outfit it may resurface if it hasn't yet.
Kind of sad for me because the first store where I bought my 800xl in
'84 went under, SJC where I bought my first asm/ed cart as well as
my ST is gone. The only place that is still doing well is B&C and
I use 'well' as a relative term. I'll try to sneak by there myself in
the next day or two so we can get an eye witness report & maybe an
address to send enquiries to.
Rick

Check out your local Radio Shack - they usually have a few joysticks around,
or at least can order them. Their cheapest model is about $9.95, plus tax
of course. That one has two buttons: base and top of stick.

Dave

>Rick

To run protected software, would it be possible to set up the PC end
to sned bit streams, copied with the BitWriter? Admittedly, this would require
a more complex hardware setup to copy, but it could make those classics
more secure and back-upable on the PC. I've only got my original MULE disk -
if it ever goes, so do I ;-)

Some things are easier with a command line, others are easier with
icons etc. That's why I like using X-Windows - you get both.

>There is no reason a gui and a shell can't coexist. It does in AmigaDOS
>and also with Unix/X (and please no semantics about how X isn't a GUI).
>If the developers fail to provide a cli fallback that is their own loss.
>
>I am not familiar enough with the newer OSs to know whether they have
>this or not.

I believe Windows '95 has an MS-DOS style command line available,
which can start Windows programs. I'm sure they're considering it
"deprecated", though. There are a few vendors (mostly shareware)
selling command lines for MS-Windows, but I've only seen one I really
like.
OS/2 has a command line within their "Presentation Manager" GUI.
Dunno about Macs, but I'm not aware of any command lines there.

Basically, major GUI's that are designed for non-computer people (Mac,
MS-Windows) seem less likely to have command lines than those designed
for techies (Unix/X, OS/2).

Actually, the Okimate worked out just fine.. Printed several Koala pics in color, and dumped text files to it - but I just couldnt find a practical use for it.

I suppose I could put it in my shed for 3 years - and by that time, my new son will be old enough to draw his images, then print them.

7807. Atari 8-bit PMG page flipping!?!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-28 04:09:07 UTC
From: KENDRICK@sonoma.edu
Message-ID: <941227200947.206024ba@sonoma.edu>
Source record: 95884
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer

Ok, I'll admit it, I'm working on an Adventure clone for the XL's.. here's my problem.. I can't seem to get page flipping done correctly when it comes to adding extra players to the screen. I'm stealling the idea used with the 2600 version (or at least what it looks like they did) and have everything split up like this:

There are 13 objects: 3 dragons + 3 keys + 1 Sword + 1 Magnet + 1 Bridge + 1 Door (per screen) + 1 Bat + 1 Chalice + 1 Player

The player can be handled by missiles or a missile.

That leaves 12 objects. There are 4 players allowed on a screen, so what I did was divided the visible objects into three frames.

In frame 1, you see: Dragon 1, Key 1, Sword, Door; if they're there.
2, you see: Dragon 2, Key 2, Magnet, Bat; if they're there.
3, you see: Dragon 3, Key 3, Bridge, Chalice; if they're there.

I know that PMG pages must be multiples of 1K for it to work (ie, if you say 20480, 20481 ... 20736, 20737 ... 21503, it'll not care and act as though you said 20480 was the PMBASE page.)

I didn't realize the paging was 1K, and thought it was 256 bytes, and it ALMOST worked like that.. But two of the frames had the same objects! They were in the same vertical place, of course, but in different horizontal places and of different colors. (The code to do the paging does this: Changes all horizontal locations of the players, Changes the PMBASE, and changes all colors of the players)

Now, I can go around this and just swap in and out 512 bytes of data per frame, but it's SOO much faster just to page through it! What do you folks think? Can you help!

I can post the code, if you want.. it's sorta sloppy (all the debug crap I did) and it's in Action!.. Also, I tried two ways of allocating memory; one was to make an array and have the PMBASE point to the first 1K boundary within the array (I made the array 1K bigger than how much of it I'm going to use), the other was to do PAGE=(DLIST/4096-1)*4096, like Mapping described.. Neither works when my pages are 1024 bytes, I just get a blank screen (no PMGs). When I change the pages to 256 bytes, I (as I said) get two frames with the same objects and vertical positions! :(:(

HELP!

thanx!

7809. ATARI 2600 ---->ATARI 8-Bit Disk Files???

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-28 04:52:21 UTC
From: ebgevza@oak.grove.iup.edu
Message-ID: <3dqqu5$3tp@jake.esu.edu>
Source record: 95886

Well, As this is the first message Ive posted on the newsreader
Let me take a min to say Hi to everyone....HI!
Any way Im the DISK DOCTOR
Or so Ive been called
Since 5th grade in school..Im now in college going BS in comp sci
and minoring in Chemistry...No sleep for the wicked 8(
Anyway, I was once on the cleveland FREENET, and I was in a sig
for the atari 8-bit...it contained a file for some
project that Ive put off for way too long now. I have the know-how
to make this one work...I hope and Id like to try it
It says that there is a way to WIRE an atari 2600 into MY
8-BIT atari and dump the memory of a 2600 cartridge into
my 8-bits memory buffer, then safe that buffer as a disk file?
Well, I have MANY 2600 cartridges on storage at my place and Id like
to put these cartidges into DISK format to make them
more accessable. Would this be possible to do or not?
If any1 has access to cleaveland FREENET could you please
see about sending me the files down?
I could use them, as I have lost the old copies and need new ones.
Thanks-
^ ^

Are there any shops in the US that still sell 8bit stuff? I would like to buy the Action! cartridge and the runtime package (presume compiler is meant), but have no way of doing so in NZ.

I don't mind it being second hand or anything - just as long as it has all the manuals.

I have only seen a couple of listings in Action! but the 50-200 times faster than Atari basic appeals to me, so that I don't have to write _everything_ in assembler all the time.

So if anyone can give me an opinion of how they find/found Action! that would be handy too.

Thanks,
Richard =8-]

PS. I won't start posting stuff for sale everyday or anything *grin*

This won't work for banked ROMs, which are the majority of the really good 2600 titles.

You could try simulating banked ROMs but it just get's more tricky at that stage. Good idea, though.

If you get 4K or 6K games to binary you can probably get the Starpath Supercharger to run them, but you'd use an Apple as the fileserver, not an Atari.

Would it be possible to use DLIs to enable your multiple creatures? DLIs
will let you redefine X on the fly; provided everything doesn't appear on
the same Y position, it should be workable.

No, I have some old magazine here with an ad for DesqView (from Sept.1992
Computer Currents) and it IS a GUI! It has the following windows open:

Some DESQview/X (AHH! .. that's it.. that "X" there.. ok, so there's
probably a difference between DESQView and DESQView/X) .. anyways,
it has a menu for controlling windows
MS Windows (yes, running under DESQView/X)
A clock
A picture of a dog
A WP program? with a picture of a car
"Paradox 3.5" looks like some database or user manager or something
Lotus 1-2-3 for DOS

Looks pretty cool.. Wish I could use it but it requires a 386/486 (no
Pentiums back then :)) and costs $275! (Back then).

Not unlike what I'd like to see for the Atari.. (of course, old programs
would need to snap to full-screen and have an interrupt installed which
would allow swapping out of the program temporarily :))

The last I heard was that SJC had to move out to a smaller location
and as a result had many products they were liquidating, this was
spring/94

Actually, the 2600 doesn't use flipping. I beleive that the
programmer has to redraw the screen for every frame. Since too many objects
take too long, they have to be drawn alternate screens.

(I may be wrong about this; feel free to jump in and correct me)

Dave

Source record: 95895

I've thought about doing some hacks with SIO2PC, but never got around
to it. IMO: All that would be necessary is to have a real drive with
the copy protected disk as the boot drive with a SIO2PC cable set up
to listen in & record everything. The IBM/SIO2PC would just replay the
interchange for all subsequent boots. Since we pretty much don't allow
Copyrighted software anywhere on the net, it wouldn't contribute to
piracy since you'd have to have the orignal disk in order to get a
bootable image. What I would suggest for now is making as much of
a back-up as you can. I have had disk go just 'a little' bad in the
data sections, but the bad sectors always seem to last forever. Sometimes
you can save a disk by redoing everything but the copy protection. If
worse comes to worse, maybe a trade in copy protected disk could be done
by people with Happy's where the only thing on the disk is the copy
protection.
I don't want to sound unconcerned, but I don't spend that much time
with commercial software. It's harder for me to get off my duff & do
something when it doesn't affect me on a daily basis.

7821. Commercials, ads and Massive Auctions

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-28 18:26:00 UTC
From: da_pate@pavo.concordia.ca
Message-ID: <28DEC199413262941@pavo.concordia.ca>
Source record: 95904

I must admit that I do advertise on the net, in this group actually (though from a commercial provider; the university will cut off access if I do it from here). What it all boils down to is courtesy.

Posting 34k text files every 24 hours for a week will make anyone your enemy. When I advertise, I try to limit it to one screen (about 20 lines). I give enough info for people to decide, and provide all the contact info they'll require. That's it. I don't post to comp.sys.cbm, or alt.fan.lemurs because I'm not selling anything that would interest them.
Our "massive" friend would be well-advised to only post the pertinent parts to the pertinent groups - I wouldn't object to a 1 or 2k file about the Atari 8-bit stuff he's auctionning off. But I _really_ don't care about Intellivision or other stuff. Seems to me that if he's got so many spare computers kicking around, he might as well use one to maintain his auction lists and split them for mail to specific groups.

Common sense and courtesy. That's all it takes.

Dave

7822. Intel outside demo.

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-28 19:07:56 UTC
From: Masstorage@closer.brisnet.org.au
Message-ID: <17c_9412290357@softtech.brisnet.org.au>
Source record: 95705

Have finally got the intel outside demo today. However side B has an error on it. Does anybody have the complete demo??? Could you please diskcom side B and uuencode it to me? I will then update my local ftp sight with it. I got the files from the atari connection bbs. Also does anyone know where and what the inteloutside demo files are on umich??

Just a couple of comments about it. I think the part that has the full screen moving with some sort of blit is i think nothing more then charactor set animation. The top #3 Has a dancing girl, that uses GR0 and Charactor set animation. Tis amazing what can be done.......

The vector graphics i have seen something like before in another demo by OU5SOFT, except it is line drawings that are not filled in. Must dig it out and upload it to my local site.......

7823. Massive Auction Guy

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-28 19:50:00 UTC
From: John Haines <john_haines@pointless.gen.nz>
Message-ID: <41229090136$6FC8@pointless.gen.nz>
Source record: 95898

Hi Bernard, you were talking about this guy who is plastering those MASSIVE auction messages in this 8-bit area... - I also am getting very sick and tired of getting these messages as I port this base over to my 8-bit BBS so my Atari 8-bit people have access to them, and my importer program has to split up every one of his messages to go into my bases... (which makes the processing time quite a lot longer than it should be...) - I could probably solve the problem on my board by getting the importer to ignore everything from this person, but it doesn't solve the problem for all the other Internet users that have to wade through his messages...
Isn't there a Moderator or some such person that could maybe do something about the problem???

I called the San Jose Computers (SJC) number and got Mark Dalldorf's (sp) answering machine. The machine says San Jose Computers would be closed during the month of January while it moves and gets reorganized. There will be a referral to the new phone number once that happens. Here is the current SJC number if you want to hear the message or leave Mark a word. (408) 995-5080 I will let you know if he returns my call.

7827. Re: SIO2PC or 850 Interface?

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-29 06:00:55 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3dtjan$lhr@nic-nac.CSU.net>
Source record: 95709

Perhaps it is because I have very little commercial software that I feel this, but I'm VERY uninterested in seeing the next hack of SIO2PC be one for copying protected software! :) 95% of the software I have is PD/Shareware/Demo and the other 5% I never play anymore. :) (Although I'd REALLY liek to borrow my friend's "AR:City" some day again! :))

Anyway.. the hack >I<'m interested in is better PC file support and more automation. Perhaps a device handler or a new version of the MyDOS DUP.SYS and a command line interface for SpartaDOS which let's you read PC directory listings, select files to include, and even be able to write back to the PC files!?

Actually, the ideas are nearly limitless, but my post shall not be (for this you should thank me <hehe>)...

Anyone else have ideas/suggestions? Reply or e-mail (I'd prefer reply so everyone else can read)

From: kendrick@zippy.sonoma.edu
Message-ID: <3dtjns$lmv@nic-nac.CSU.net>
Source record: 95708

Am I the only 8-bit demo lover these days!? You folks should go get a copy of the Top Magazine Oct.1994 at UMich. I DL'd side B because I wanted some new games (hehehe; they usually put some games or game demos and applications or app. demos on side B; the text (usually German) and text reader on side A) and was PLEASANTLY surprised to see the "Bitter Reality" demo I was interested in seeing (which was mentioned in the Shadow's Party (PARTRO*.*) demo disk).

Anyways.. it's very cool! Nice loaders, supports high speed disk I/O, plays music during loading, has the most COLORFUL plasma I've seen (it'd impress most of my VGA/SVGA+PC-owning friends, I'm sure!), has a pretty well done 3D solid-poly vector part, very FEW scrollers, and lots of other unique effects (mirrored sinus-wave scrollers, except they're vertical, and they're multicolored, and they're occupying the same area as a bunch of blittered graphics! ... claims 8 PMG's per scan line down most of the screen).

Anyways, go get it! It's only a 1050 disk worth!

ALSO! on a side note: WHEN IS THE CORRECT VERSION OF CARD STAX TO BE PUT ON UMICH! The current copy is from Dec.10, 1994 and is the corrup version! (which crashed my PC when I ran DCM2DSK on it!)

thanx!

> So, we were both right! :)
>

Perhaps terminology ... DesqView (not X) is not a graphic user
interface, but a windowing system/multitasking system which will
support graphical applications in the separate windows. IE --
DesqView is not necessarily limited to text type applications, but
does not implement an Icon/Graphical environment, more of a
windowed screen switching/sizing environment, much like a number
of dumb terminals with multiple windows available.

Also, as to pricing, I got my copy of Desqview for (as I recall(
something like 49 or 75 dollars as part of a bundle with their
spread sheet, and such. Sometime junk mailing lists are good for
something, as well as the pricing pressure Microsoft seems to put
on everyone when they muscle their way around.

No, it sounds very much like a joyport interface _I_ designed and built
back in 1983 (using a 74164 and a 74LS14), complete with a little (<1K)
auto-relocating P: driver...
Possibly we weren't the only ones to come up with this idea? :-)

(BTW: if anybody is interested in the source code for the driver I could
try to dig it up - assuming the disk is still readable...)

JW> is a multitasking environment. But I think GUI (Graphical User
JW> Interface) really requires graphics rather than text...does it not?

I have used DeskView whith Sio2Pc and its not a hit when you write stuff to an Diskimage and I dont recomandate it at all. But I have big use for it anyway when I work whith PD-Stuff and write descriptions at the same time in Swedish. Then I have one window whith Sio2pc and another whith Qedit. But you must have the window whith Sio2Pc active when the Atari is reading from his image.!!

I think some of us get depressed by demos which are so good and yet so useless overall because the programmers seem to only be interested in topping their hacker buddies and throwing useless 'greetinx' scrollers in them rather than taking some of their programming expertise and writing a game or something.

You yourself, Bill, know that the Intel demo people don't seem to have done anything productive with the polygon engine they created.

I think demos should be precursors to something substantial, not be all and end alls.

I think the polygon stuff is really amazing that it is possible, but it is merely another thing to chalk up as a thing with the Atari CAN do that was never taken advantage of if no programmers use it for anything beyond the static demo.

I get too depressed as it is thinking about what the Atari8 can do, but won't because noone will program it to do it. Other platforms have had a far greater percentage of their potential tapped.

Subject: 1.1) What is this 8-bit Atari FAQ List?

The Atari 8-Bit Computers Frequently Asked Questions List was created to provide answers to many commonly asked questions found in news:comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8. It is in a constant state of development.

Much of this FAQ List is geared toward providing information on the various Internet resources available for 8-bit Atari users.

Where to get the latest copy of the 8-bit Atari FAQ List

The home of many FTP archive sites, automatically updated monthly:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq

The World Wide Web hypertext version, automatically generated monthly:
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html

Usenet newsgroups where this FAQ List is automatically posted monthly:
news:comp.sys.atari.8bit news:comp.answers news:news.answers

You can also get the latest version by e-mail.
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 1.2) What is an Atari 8-bit computer?

In order of their release, the 8-bit Atari computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 199 . [<- I can't believe I forgot already.]

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

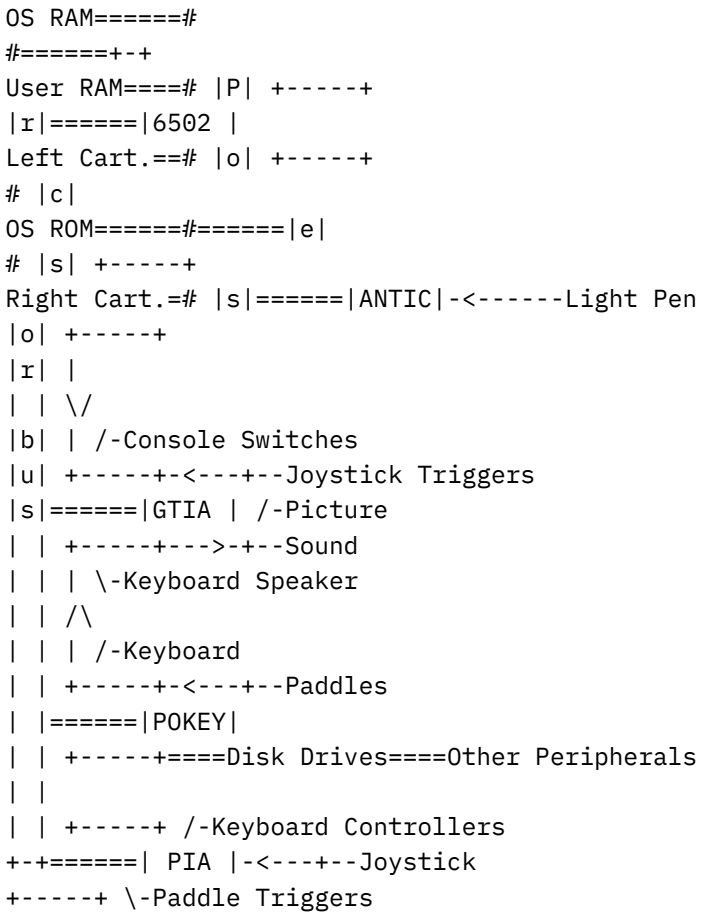
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE. According to Masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU

and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO freddy) and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

[I'd like to include the charter for news:comp.sys.atari.8bit here. Anyone know where to get it?]

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements.

[need the moderator's address]

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements.

The moderator may be contacted at mailto:emulators-request@qualcomm.com

---

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:info-atari8-request@pine.cse.nau.edu

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:info-atari8@pine.cse.nau.edu will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu, message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu.

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu. Please name the parts in the subject line. This is really helpful as the parts usually don't arrive in the proper sequence. Also, please include a message labeled "file transmission," containing a short description of the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit', address the message to comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit', address the message to comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit', address the message to comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded. Therefore, please do not use these gateways or any other similar gateways if you can post to Usenet directly.

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is

maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, U.S.A.)

b) ftp://wuarchive.wustl.edu/mirrors/archive.umich.edu/atari/8bit
(128.252.135.4, U.S.A.)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, Great Britain)
d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, U.S.A.)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, U.S.A.)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu. This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen, mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves them to the appropriate directory. Please include a .readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson, mailto:kevina@clark.net.

ftp://ftp.clark.net/pub/atari (168.143.0.2)

[Is there a place for uploads?]

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is The Atari Connection II?

This mid-sized archive is kept by mailto:jeking@xmission.com (James King)

ftp://xmission.com/pub/users/jeking/Atari (198.60.22.2)

Uploads may be placed in ftp://xmission.com/pub/users/jeking/Uploads

---

Subject: 4.7) What is the Super Archive?

Here is a "small but growing" FTP site in Australia kept (I believe?) by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer2.brisnet.org.au/pub/archive1/8_BIT (203.4.149.98)

Support site for James Bradfords Super 8-bit Products including SuperDos, SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer2.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu.

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://info.cern.ch
No password is required. This is in Switzerland, so continental
US users might be better off using a closer browser.

telnet://www@www.cc.ukans.edu
A full screen browser "Lynx" which requires a vt100 terminal.
Log in as www. Does not allow users to "go" to arbitrary URLs,
so GET YOUR OWN COPY of Lynx and install it on your system if
your administrator has not done so already. The best plain-text

browser, so move mountains if necessary to get your own copy of
Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There is also a mirror archive site with a Gopher server:

gopher://src.doc.ic.ac.uk/11/computing/systems/atari/umich/8bit

----

Subject: 7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto:eyvind@pvv.unit.no, in Norway.
Last I checked there wasn't anything there, but perhaps there is by now.

http://www.pvv.unit.no/~eyvind/atari/

Subject: 7.2) What is the Atari 8-Bit Home Page?

Run by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper), in
Holland. Very nice.

Interesting resources include:
ASCII: About the 65c816...
Documentation about the 6502/6510/8500/8502 instruction set.
Schematic of a small MIDI interface for the C64
X-Modem/Y-Modem Protocol Reference
Atari System Reference Manual
Rob Funk's Reference Cards
PostScript: Opcode table for 6502c and 65C02
Hypertext: Atari System Reference Manual
Rob Funk's Reference Cards
Software: MODPlay v1.22 Distribution
UnZip v1.13 Distribution

Also FULLY supports this FAQ List.

Point you Web client to:

http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Most resources offered are also made available through his FTP server, the "Gatekeeper's Archive."

Subject: 7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk, in Germany. Last I looked, the only thing of significance was News from ABBUC (German)

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

Subject: 7.4) What is the Big Atari 8bit Home Page?

This home page is kept by Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl, in Poland. Another nice one.

Interesting resources include:
* Atari System Reference Manual by Bob Duhamel
* "Famous Atarians" page
and the following original material by Thomas Tatar:
* Short description of the Disk Operating Systems for Atari 8bit computers
* Short (so far) description of the Atari 8bit languages
* Atari 8bit copy party, Mirow near Czestochowa, 4-5 June 1994: Results of the competitions
* Short list of the Input/Output errors

Supports the hypertext version of this FAQ list.

Point your WWW client to
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/hp.html

---

Subject: 7.5) What is the Central Atari Information Network?

CAIN, the Central Atari Information Network, is an independent
Atari user group dedicated to supporting ALL Atari products.
CAIN serves the Atari community by maintaining a FREE monthly
ASCII newsletter and an Atari Special Interest Group on The
Cleveland Free-Net Community Computer System. Furthermore, CAIN
has recently thrown the CAIN Atari Fun Fest, an Atari products
show in the Cleveland, OHIO (USA) area.

http://ace.cs.ohiou.edu/personal/mleair/cain.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

Subject: 7.9) What is #Atari8?

There is a channel on Internet Relay Chat for 8-bit Atari users. Its
name is #Atari8. Join #Atari8 on port 6667 (EFNet) and enjoy (if you
meet somebody there).

There should be a small bot called XE_BOT on this channel. While on
channel #Atari8 use the command
/msg XE_BOT help
for more information.

The latest information on #Atari8 and the XE_BOT may be found here:
http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/Atari/irc.html

Channel #Atari8 and the XE_BOT are the work of Tomasz Tatar,
mailto:tatar@student.uci.agh.edu.pl.

Subject: 8.3) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at xx004@cleveland.freenet.edu.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

This section by mailto:winston@merk.com (Winston Smith)

In the recesses of my memory, I seem to remember ".XMO" as being a
"download extender" for the download section of one of the very early ATARI
BBSes such as A.M.I.S. BBS. I seem to recall that ".XMO" implies that the
file has been transfered with an early version of XMODEM and has therefore
had CONTROL-Z pad characters appended onto the end of the file. To
retrieve a working file again, the CONTROL-Z trailer padding needs to be
stripped off. A copy of the file is made, and then a utility such as Disk
Doctor (the original program, not the SpartaDOS utility) / Download Doctor
is used to strip off the trailing padding. You probably could just load
the file into TEXTPRO and just back over the trailing bytes. The reason to
always use a copy of the file is in case of the rare instances where the
file actually ends with the CONTROL-Z character. In that case, you don't
want to back up all of the way. Bob Puff's SUPERARC was the program that
finally saved everyone from the task of manually having to strip off the
pad bytes. (Please correct me if I am wrong. In any event, that is what I
remember about ".XMO" extenders....)

Subject: 10.1) What 8-bit Atari emulators exist for other computing
platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer
List for complete contact info). A freeware 8-bit Atari emulator for the
Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu. Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains Sparta/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None

Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
Merit/UMich: Telecomm/ft80v037.arc

Ice-T 1.0 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: No
Backscroll buffer: yes (One screen)
Capture-to-disk: No
Summary: Excellent for high-speed VT100 emulation
Merit/UMich: Telecomm/icet.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the archives of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem

cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

ED w/troubles
LDW CA-2002 DS SD/ED?/DD up to 38000 bps
with SpartaDOS 70000 bps

Detailed descriptions of the TOMS 720, SN-360, TOMS 710, LDW 2000,
CA-2001 and CA-2002:

1. TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)

ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive has number D1:) or D4: (when drive has number D2:). It makes possible load DOS from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

2. SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

3. TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, Sparta DOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton Commander on PCs.
IBM-ST copier on additional disk.

4. LDW Super 2000
single head, 5.25", CPU Z80A, ROM 4 KB, RAM 256 B
Transmition: 19200 bps or 38000 bps
Formats:

- SS/SD - 90 KB
- SS/ED - 130 KB (with some troubles)
- SS/DD - 180 KB

5. CA-2001
single head, 5.25", CPU Z80A, ROM 4 KB, RAM 256 B
Transmition: 19200 bps or 38000 bps
Formats:
- SS/SD - 90 KB
- SS/ED - 130 KB (with some troubles)
- SS/DD - 180 KB

6. CA-2002
double head, 5.25", CPU 8040, ROM 4 KB, RAM 256 B
Transmition: 19200 bps (70000 with Sparta DOS)
Formats:
- SS/SD - 90 KB
- SS/ED - 130 KB
- SS/DD - 180 KB
- DS/DD - 360 KB

Floppy board various Any standard very fast parallel
DOS-transparent
Requires Black Box
DS system configurable for
XF Percom or ATR style
HDI various Any standard very fast SIO? European
SWP ATR-8000 Any standard standard
except 1.2 and unique DS system
1.44 meg (HD)
nice Z80 CP/M system in which CP/M drive
acccess is parallel only thus faster.
Atari 1450XLD drives DS SD/ED DD? standard, requires DOS4
unusual DS system
Only prototypes exist
Atari XF521 3.5" system Unreleased

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

Amdek
XF551 upgrades
Floppy Board

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides

subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53/4 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder

XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Please let me know if any of this information conflicts with the units you have!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010
9 V AC 15.3 VA (1.7 A) Atari#CO14319 transformer:
400,800,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA014748 transformer:
400,800,810,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA016804 transformer:

400,800,810,822,850,1010,1200XL
9 V AC 31 VA (3.4 A) Atari#CO17945 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO
9 V AC 50 VA (5.6 A) Atari#CA017964 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO

9.5 V AC 40 VA (4.2 A) Atari#CO61636 transformer:
1027

5 V DC 1.0 A (5.0 W) Atari#CO70042 adapter:
65XE,XE Game System

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o F.O.R.E.M. BBS -- Friends of Rick E. Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FOREM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the ATARI 8-bit
has been placed into the public domain or not. This BBS was the first to
support a RAM-disk, which Paul Swanson called a "V:" device for "virtual
disk". This BBS was written in ATARI BASIC and required a joystick
hardware "dongle" device. This was notable as being one of the first ATARI
8-BIT BBSes that could actually go for a week without having to be

rebooted. Pointers to the message base were kept in an ATARI "very long string" (for which ATARI BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An ATARI 8-BIT version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC-XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SPARTA-DOS environment. This was a problem until very recently, when SPARTA-DOS was released into the public domain. This BBS program uses a "modem clock string" rather than an R-TIME-8 cartridge in order to retrieve the current time. It also comes with an ATARI BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC-XE.
This version of FOREM BBS requires the commercial BASIC-XE cartridge in order to run. It is in the public domain and can import and export messages from the ATARI PRO! BBS EXPRESS-NET (7-BIT text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in ACTION! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE-- demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial programs. I haven't heard anything about OASIS IV and CARINA for a while, but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 14.1) What product developers or vendors support the 8-bit Atari?

There are two files available:

1) Atari 8-Bit Computers: Vendors and Developers

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers
mailto:mcurrent@carleton.edu
and all other archives of Usenet FAQ lists.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, mailto:r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained by Lawrence Estep, AC's Telecommunications Editor, mailto:71450.1050@compuserve.com.

Subject: 14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics magazine's Exchange Editor, James King, mailto:KAMARO_KID@delphi.com.

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by Bill Kendrick, mailto:kendrick@sonoma.edu. You can write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing covers people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to the Atari SIG at mailto:xx004@cleveland.freenet.edu.

Source record: 95721

Demos are usually seen by their authors as an art form, and are therefore complete in and of themselves. I have to agree here. I enjoy popping in a demo just to figure out what's going on and to discover new 8-bit hardware tricks. I think someone could take inspiration from a demo to create something new just as well as the demo coders could. Game programming puts different demands on the programer, and maybe just playing with hardware is all these guys want to do. The fact that the demo scene is alive on the 8-bit is quite amazing. The fact that the demos are so good is incredible. At least we get to see all the programming tricks we didn't see in the pre-demo era, and we learn what the 8-bit is really capable of.

I am running B. Dash I and II OK on XFormer 2.0 and 2.5. I "uploaded" it
to my PC using SIO2PC and the cable I built myself following the specs that
came with that nice program.

Well is your ATARI 8bit BBS also running on a 8-bit and on what BBS
program ? If it is PRO BBS I like to see a copy of you importer program
for that...

> Atari 8-bit people have access to them, and my importer program has to split
> up every one of his messages to go into my bases... (which makes the processing
> time quite a lot longer than it should be...) - I could probably solve the
> problem on my board by getting the importer to ignore everything from this
> person, but it doesn't solve the problem for all the other Internet users
> that have to wade through his messages...
> Isn't there a Moderator or some such person that could maybe do something
> about the problem???

No there is NO Moderator but that guy has to stop posting his messages...
He can POST his message 1 time in a month and people that like to bid can
write to him E-mail adres..... and he DON'T have to post his HOLE message
in c.s.a.8 because there are also other game computers in this list....

Every one who not like his ACTION list write a meesage to him and let him
know, maybe he will stop if there are MORE people that do NOT like it..

> Am I the only 8-bit demo lover these days!? You folks should go get a copy

Does anybody remember the BIG DEMO, marketed by those guys at Page 6/New Atari User?? I was in love for it for weeks and weeks after I bought it! As I remember, it contained a trillion (ahem) or so musics from various Atari and C64 games (which looking back a year or so, were all the rage on the 16-bits and PC's), dozens of different scrollies and gawd knows how many different flying blit screens!

At the time, I thought it was the best UKP 4.95 I'd ever spent! :-)

If anybody has a copy they'd like to donate to the 8-bit addicts hospice, via my E-Mail address, then by all means do so!

Cheers, Ric.

I just acquire PC XFormer for my machine, and am happily coding and playing classic disk based games. However, I miss my cartridge based games and programming languages like Antic!. I've heard that you could copy ROM cartridges to a 8k file. How do I do it? Ten years ago, I remember disassembling my BASIC cartridge. Ten years ago is a long time to remember. :) Can anyone help me out?
Thanks,
Wes Brown

7847. (Revised) Copying my ROM cartridges.

Well Glenn, we know that at least SOME software has come from Europe, so it's not like that's ALL they do! Torsten Karwoth did demo stuff, demo music, as well as MegaBlast-I, a GAME (not the best game, very impressive, but still, a small game compared to what could be done) and a CLI for MyDOS 4.50 (which sucks cuz I use 4.53/4).

Hard Soft did at least one game back when they first appeared, and hopefully after they get their next <gulp> demo out, we can convince them to do a game (they've shown interest in ideas I've had lately).

But.. in general I do agree with you. Of course, how do we know that they aren't producing commercial games!? I've heard of a few new commercial titles from Europe but know very very little about them. I'm sure TopMagazin has plenty of info on new games and such, but :) I can't read German!

Oh well.. perhaps we need an Internet liason to these demo-makers.. I mean, their work is getting out her SOMEHOW! Who uploads TopMagazin's and these new demos!?

Anyway.. I'll shut up now, I'm losing my mind I think.. but before I go, if any of those demo-makers are listening, I think they should make some puzzlish game out of those bouncing checkerboards (sorta like the 3D thing in one of those Sega Sonic the Hedgehog games) and they should make either a VRish game or a space game out of the polygon graphics. Everything else can just be mood stuff, or animation for storylines or something...

(OH! AND BE SURE IT ALL WORKS 100% ON OUR NTSC MACHINES! :))

Bye!

(About copying carts to disk.)
Many, probably most carts are copy protected. Many are bank switched.
In other words, you can't readily copy most commercial game carts.
The person who copied his BASIC cart was no big problem, the BASIC cart
is a straightforward, non-protected, 8k cart. There were very few of
those produced, I think.

From: per-erik_peterson@asb2.ct.se

Bernad Kok writed his thoughts about this Massive Auktion for some days ago.

This is the only newsgroup I read and I heard that this lists goes in a lot of different newsgroups. I support Bernad and Russ Gilbert in this matter. Often I cannot see the lists because I dont have so mutch memory left in my ST or when I do I push my Return buttom as I'm not persinally intrested of them.!!

I got a lot of original 8K cartridges, which I'd doubt is copy protected. I'm talking about 1979-1981 era cartridges. :) Stuff like Star Raiders, Dig Dug, etc. I'm still asking HOW. :) How do you copy these cartridges?

Wes Brown

(Wes Brown asks how to copy carts.)
There's two ways I know of. Star Raiders I copied using 'The Impersonator', a cart copy program which requires that a dummy cart be used with the disk file you make by inserting the cart in the correct way using the cart copy program that comes with 'Impersonator'. There are other cart copy 'systems' I believe. It also may be possible to use osnxl omnimon os that comes with the ramrod os plug in module available from FTe. osnxl allows you to hit SELECT and RESET and pop into a machine language monitor. From this point you can dump any area of memory to disk sectors, then you have to know how to make the disk sectors into a file. But still, I think Star Raiders worked with the 'Impersonator'. I don't know about 'Dig Dug'.

7856. Re: HELP??? was MASSIVE AUCTION VI -- update #3

Newsgroup: comp.sys.atari.8bit
Date: 1994-12-31 11:32:56 UTC
From: winston@merk.com
Message-ID: <D1oAqx.GEA@merk.com>
Source record: 95738

I wouldn't mind the "MASSIVE AUCTIONS" if they were done intelligently, that is, only posting the items that apply to each NewsGroup and leaving pointers on how to get to the other listings. Something along the lines of:
ATARI 8-BIT:
STAR RAIDERS $5.00
DIG DUG $5.00

TI99: (See Listing in "COMP.SYS.TI99")
Games: 35 carts, 120 disks
Educational: 230 disks

...but why in the world would I want to see 385 listings about the TI99/4A in the ATARI 8-bit Newsgroup, for example ? Maybe his Sysop could help him with a WWW Home Page or a split mailing of some kind, such as an automated SHAR or PWB PUMP to split his list and do piecemeal mailings through a pipe filter. Or maybe he could post in a "forsale" base and post pointing messages to his list into the various NewsGroups. There has to be a more intelligent way to post forsale messages without going so far off-topic. There must be a better method than posting duplicate messages in all of the groups, only a small portion of which is of any interest to any particular group at any one time... I agree. There should be a better method for accomodating everyone by focusing the sales pitch more narrowly. Maybe he could post in REC.VIDEO.GAMES and leave a message in this NewsGroup saying: "Hey! There is some of my ATARI 8-BIT stuff for sale in REC.VIDEO.GAMES...." Most of us would probably check it out.

I've read all the discussion about this, and agree with some of
it.
On one hand, it is indeed bothersome to see these messages
repeated so frequently (I'm talking about the auction messages). It is
a waste of a lot of time, bandwidth and disk space.
On the other hand, I find that buying items over the net is
a good way to get things that aren't available any more.
So, for instance, when James King posts a list of items that
he is willing to part with, I applaud him. :) He posts lists of
items that are relevant to our subject matter. He posts them once
only. This is a good thing, as it moves product from those who do
not want it to those who do (as well as some money! [grin]).
But when someone posts a list of TI carts, or even 2600 or
5200 carts, to this newsgroup, I do not appreciate it. I'll read
rec.games.video.classic if I want Atari videogame carts. I don't
need that list here, and I don't think others do either judging from
the response.

So, while I would oppose an all-out ban on commerce over the
net (as that would disallow James King-type posts [Sorry to single you
out, Mr. King :)]), I would like to see some restraints on the subject
matter or products offered within such posts, as well as a restriction
on frequency of posting.

Another alternative would be to create a specific newsgroup for
selling "classic" computer and/or videogame items. However, this would
necessitate reading yet another newsgroup, and wading through a lot
of irrelevant messages (items I don't want).

So, let's keep the ads here, but let's keep them reasonable! :)

Just my thoughts on this...

-Joe
